**VALENCY PLATFORM MOLECULES  
COMPRISING AMINOXY GROUPS**CROSS REFERENCE TO RELATED APPLICATIONS

This application claims the benefit of U.S. Provisional Application No. 60/138,260, filed June 8, 1999, the disclosure of which is incorporated herein by reference in its entirety.

TECHNICAL FIELD

This application relates to molecules comprising aminoxy groups that can be covalently attached to other molecules. In particular, this application relates to valency platform molecules comprising aminoxy groups to which one or more molecules, such as biologically active molecules, may be attached to form a conjugate.

BACKGROUND ART

A "valency platform" is a molecule with one or more (and typically multiple) attachment sites which can be used to covalently attach biologically active molecules of interest to a common scaffold. The attachment of biologically active molecules to a common scaffold provides multivalent conjugates in which multiple copies of the biologically active molecule are covalently linked to the same platform. A "defined" or "chemically defined" valency platform is a platform with defined structure, thus a defined number of attachment points and a defined valency. A defined valency

platform conjugate is a conjugate with defined structure and has a defined number of attached biologically active compounds. Examples of biologically active molecules include oligonucleotides, peptides, polypeptides, proteins, antibodies, saccharides, polysaccharides, epitopes, mimotopes, drugs, and the like. For example, the

5 biologically active compounds may interact specifically with proteinaceous receptors.

Certain classes of chemically defined valency platforms, methods for their preparation, conjugates comprising them, and methods for the preparation of such conjugates, have been described in the U.S. Patents Nos. 5,162,515; 5,391,785; 5,276,013; 5,786,512; 5,726,329; 5,268,454; 5,552,391; 5,606,047; and 5,663,395.

10 Valency platform molecules comprising carbamate linkages are described in U.S. Provisional Patent Application Serial No. 60/111,641; and U.S. Serial No. 09/457,607, filed December 8, 1999.

### DISCLOSURE OF THE INVENTION

Molecules comprising aminooxy groups are provided, as well as conjugates thereof with other molecules such as biologically active molecules, and methods for their synthesis. The aminooxy groups provide attachment sites for the covalent attachment of other molecules.

In one embodiment, polyethylene oxide molecules, or more particularly, polyethylene glycol molecules, comprising aminooxy groups are provided that can be conjugated to a wide variety of biologically active molecules including poly(amino acids). In another embodiment, valency platform molecules comprising aminooxy groups are provided. The aminooxy groups can be used to form covalent bonds with

25 biological molecules, such as poly(amino acids). The aminooxy groups can, for example, react with poly(amino acids) modified to contain carbonyl groups, such as glyoxyl groups, to form a conjugate of the valency platform molecule and the biologically active molecule via an oxime bond. The valency platform molecules comprising aminooxy groups are advantageously reactive in the formation of

30 conjugates, and they also can be readily synthesized to form a composition with very low polydispersity.

Molecules comprising aminooxy groups, preferably 3 or more aminooxy groups, such as valency platform molecules comprising aminooxy groups, can be covalently linked to one or more, or, for example, 3 or more, biologically active molecules, including, for example, oligonucleotides, peptides, polypeptides, proteins, antibodies, saccharides, polysaccharides, epitopes, mimotopes, or drugs.

In one embodiment, a molecule comprising aminooxy groups is provided, wherein the molecule comprises oxyalkylene groups, *e.g.*, oxyethylene groups or polyoxyethylene groups. The molecule may comprise, *e.g.*, at least 3 aminooxy groups, or 4, 5 or more aminooxy groups.

As used herein "oxyethylene, oxypropylene and oxyalkylene" are used interchangeably with "ethylene oxide, propylene oxide and alkylene oxide".

In another embodiment, there is provided a valency platform molecule comprising aminooxy groups. In one preferred embodiment, the valency platform molecule comprises at least 3 aminooxy groups. The valency platform molecule may further comprise oxyalkylene groups, *e.g.*, oxyethylene or polyoxyethylene groups, *e.g.*,  $-(CH_2CH_2O)_n-$ , wherein *n* is 200 to 500.

Also provided is a composition comprising a molecule, such as a valency platform molecule, such as those disclosed herein, comprising aminooxy groups and having a polydispersity less than 1.2, *e.g.*, less than 1.1, or less than 1.07.

In one embodiment, there is provided a valency platform molecule having the formula:

Formula 1

wherein in one embodiment:

*m* is 1-50 or more, *e.g.*, 3-50; and

*R* is an organic moiety comprising 1-1000, or 10,000 atoms or more selected from the group consisting of H, C, N, O, P, Si and S atoms.

In another embodiment, there is provided a valency platform molecule having the formula:

## Formula 2

wherein in one embodiment:

y is 1 to 16;

n is 1 to 32;

5 wherein in one embodiment the product of y \* n (y multiplied by n) is at least 3; and

$R^c$  and each  $G_1$  are independently an organic moiety.

10 In one embodiment,  $R^c$  and each  $G_1$  are independently an organic moiety comprising atoms selected from the group of H, C, N, O, P, Si and S atoms, and optionally comprise oxyalkylene groups. The molecules may be provided in a composition having a polydispersity less than 1.2.

In another embodiment, a valency platform molecule is provided having a formula selected from the group consisting of:

15 Formula 3;

Formula 4;

Formula 5;

Formula 6;

Formula 7; and

25 Formula 8;

wherein, for example:

y is 1 to 16;

n is 1 to 32;

30 wherein in one embodiment the product of y \* n (y multiplied by n) is at least 3;

$R^1$  is H, alkyl, heteroalkyl, aryl, heteroaryl or  $G_2-(ONH_2)_n$ ; and

00590592-060300

$R^c$  and each  $G_2$  are independently organic moieties comprising atoms selected from the group of H, C, N, O, P, Si and S atoms.

In one embodiment,  $R^c$  and each  $G_2$  independently are selected from the group consisting of:

hydrocarbyl groups consisting only of H and C atoms and having 1 to 200 carbon atoms;

organic groups consisting only of carbon, oxygen, and hydrogen atoms, and having 1 to 200 carbon atoms;

organic groups consisting only of carbon, oxygen, nitrogen, and hydrogen atoms, and having from 1 to 200 carbon atoms;

organic groups consisting only of carbon, oxygen, sulfur, and hydrogen atoms, and having from 1 to 200 carbon atoms;

organic groups consisting only of carbon, oxygen, sulfur, nitrogen and hydrogen atoms and having from 1 to 200 carbon atoms.

In one embodiment of the valency platform molecule,  $R^c$  is selected from the group consisting of a C1-200 hydrocarbon moiety; a C1-200 alkoxy moiety; and a C1-200 hydrocarbon moiety comprising an aromatic group.

$R^c$  optionally may comprise an oxyalkylene moiety, such as an oxyethylene moiety ( $-\text{CH}_2\text{CH}_2\text{O}-$ ). In one embodiment  $R^c$  comprises oxyethylene units:

wherein n is 1-500, e.g., 200-500, 1-200, 1-100 or 1-20.

In one embodiment, each  $G_2$  independently comprises a functional group selected from the group consisting of alkyl, heteroalkyl, aryl, and heteroaryl.

In another embodiment, each  $G_2$  independently comprises a functional group selected from the group consisting of a C1-200 hydrocarbon moiety; a C1-200 alkoxy moiety; and a C1-200 hydrocarbon moiety comprising an aromatic group.

Each  $G_2$  independently can comprise an oxyalkylene moiety, such as an oxyethylene moiety ( $-\text{CH}_2\text{CH}_2\text{O}-$ ). In one embodiment, each  $G_2$  independently comprises oxyethylene units:

wherein n is 1-500, e.g., 1-200, 200-500, 1-100 or 1-20.

In one embodiment of the valency platform molecule each  $G_2$  independently comprises a functional group selected from the group consisting of amine; amide; ester; ether; ketone; aldehyde; carbamate; thioether; piperazinyl; piperidinyl; alcohol; polyamine; polyether; hydrazide; hydrazine; carboxylic acid; anhydride; halo; sulfonyl; sulfonate; sulfone; cyanate; isocyanate; isothiocyanate; formate; carbodiimide; thiol; oxime; imine; aminooxy; and maleimide.

In one embodiment, in the valency platform molecules, each  $G_2$ -ONH<sub>2</sub> is independently selected from the moieties shown in Figure 17.

In another embodiment, valency platform molecules are synthesized using a linker comprising an aminooxy or protected aminooxy group on one end. The other end may include an amine, as illustrated in compounds 11 and 100 in Examples 3 and 17, and in Figures 3 and 25; an acid carbonate ester as illustrated by compounds 18 and 28, and Examples 4 and 6, as well as Figures 4 and 7; a thiol, as illustrated by compounds 22a and 22b, Examples 5a and 5b, and Figures 5 and 6; an aminooxy, as illustrated by compound 37, Example 8 and Figure 9), or a carboxylic acid or activated derivative as illustrated by compound 105 and 106, Examples 16 and 20, and Figures 24 and 28.

In another embodiment, compounds of Formulas 9-13 shown in Figure 19 are provided. In Formulas 9-13, in one embodiment,  $R_c$  and  $G_2$  are as defined above, and  $n$  is about 1-500, e.g., 200-500, 1-200, 1-100 or 1-50.

In a further embodiment, valency platform molecules are provided having the structure:

where  $n$  is about 503 or e.g., more than about 500, more than about 600, or more than about 700 or 800 or more;

where n is about 112, or *e.g.*, more than about 500, more than about 600, or more than about 700 or 800 or more;

or the structure:

where n is about 481, or *e.g.*, more than about 500, more than about 600, or more than about 700 or 800 or more.

Also provided are conjugates of a molecule comprising aminooxy groups, such as any of the valency platform molecules disclosed herein, and a biologically active molecule. The biologically active molecule may include, for example, poly(saccharides), poly(aminoacids), nucleic acids, lipids and drugs, and combinations thereof. The conjugates include an oxime conjugate or modified form thereof, such as reduction products, such as aminooxy, and alkylated forms.

Also provided is a method of making a conjugate of a molecule comprising aminooxy groups, such as any of the valency platform molecules disclosed herein, and a biologically active molecule, wherein the method comprises reacting aminooxy groups on the molecule comprising aminooxy groups, such as a valency platform molecule, with a reactive functional group, such as the carbonyl, for example, of an aldehyde or ketone group, on the biologically active molecule to form an oxime conjugate. In the embodiment wherein the biologically active molecule is a poly(amino acid), the method may further comprise modifying the poly(amino acid) to include a terminal aldehyde group prior to the conjugation.

Also provided are pharmaceutically acceptable compositions comprising the conjugates disclosed herein, optionally in a pharmaceutically acceptable carrier.

### MODES FOR CARRYING OUT THE INVENTION

Molecules comprising aminooxy groups are provided. The aminooxy groups may be provided on molecules such as polymers, for example at the terminal position, to provide attachment sites for the covalent attachment of other molecules, such as biologically active molecules. For example, a wide variety of polymers, such as poly(alkyleneoxide) polymers, including poly(ethyleneoxide) polymers, in particular polyethylene glycols, can be modified to contain aminooxy groups. The aminooxy groups are advantageous because they can be used to react rapidly and in good yields with other molecules containing reactive groups, preferably aldehyde or ketone groups, to form a covalent conjugate with the other molecule. Aminooxy groups provide improved results in reacting with an aldehyde or ketone to form a stable conjugate in the form of a C=N bond, in comparison with other nitrogen containing functional groups, such as amines, hydrazides, carbazides and semicarbazides. The aminooxy groups permit both reduced reaction time and increased yield of product.

Other molecules that can be modified to include aminooxy groups include branched, linear, block, and star polymers and copolymers, for example those comprising polyoxyalkylene moieties, such as polyoxyethylene molecules, and in particular polyethylene glycols. The polyethylene glycols preferably have a molecular weight less than about 10,000 daltons. In one embodiment, polymers with low polydispersity may be used. For example, polyoxypropylene and polyoxyethylene polymers and copolymers, including polyethylene glycols may be modified to include aminooxy groups, wherein the polymers have a low

polydispersity, for example, less than 1.5, or less than 1.2 or optionally less than 1.1 or 1.07. Preferably, the polymers comprise at least 3 aminooxy groups, or at least 4, 5, 6, 7, 8, or more.

Nonpolymeric molecules also can be modified to include aminooxy groups as disclosed herein. For example, chemically defined non-polymeric valency platform molecules, such as those described in U.S. Patent No. 5,552,391 can be modified to include aminooxy groups.

Also provided are compositions comprising such molecules and conjugates, for example in a pharmaceutically acceptable form, for example, in a pharmaceutically acceptable carrier. Carriers for different routes of administration, including oral, intravenous, and aerosol administration are described in the art, for example, in "Remington: The Science and Practice of Pharmacy," Mack Publishing Company, Pennsylvania, 1995, the disclosure of which is incorporated herein by reference. Carriers can include, for example, water, saccharides, polysaccharides, buffers, excipients, and biodegradable polymers such as polyesters, polyanhydrides, polyamino acids and liposomes.

Pharmaceutically acceptable compositions are compositions in a form suitable for administration to an individual, for example, systemic or localized administration to individuals in unit dosage forms, sterile parenteral solutions or suspensions, sterile non-parenteral solutions or oral solutions or suspensions, oil in water or water in oil emulsions and the like.

#### Valency Platforms

In one aspect, valency platform molecules comprising aminooxy groups, conjugates thereof with molecules such as biologically active molecules, and methods for the preparation of such platforms and conjugates are provided.

A variety of valency platform molecules are known in the art. Preferred are chemically defined valency platform molecules. Methods for making valency platform molecules are described, for example, in U.S. Patents Nos. 5,162,515; 5,391,785; 5,276,013; 5,786,512; 5,726,329; 5,268,454; 5,552,391; 5,606,047; 5,663,395 and 5,874,409, as well as in U.S. Serial No. 60/111,641 and PCT US97/10075. In general, these platforms contain core groups or branched core

groups which terminate in hydroxyl groups, carboxyl groups, amino groups, aldehydes, ketones, or alkyl halides. These groups can be further modified to give the desired reactive groups, and to obtain a valency platform molecule comprising preferably at least three aminooxy groups.

5 Valency platforms are prepared from core groups which contain the desired valence. A chain can provide a valence of one or two, depending on how the chain is terminated. Chains which are branched can provide a valence of three or more depending on the number of branches or side chains. For example, triethylene glycol, has a valence of two, ethanol has a valence of one, pentaerythritol has a valence of  
10 four. These are chains which terminate in hydroxyl groups which can be further modified to provide desired reactive groups. Chains can also terminate in other groups such as amines, thiols, alkyl halides, carboxyl groups, aldehydes, ketones, or other groups which can be further modified.

These chains can serve as core groups. The valence of a core group can be  
15 increased by derivatizing the terminal functionality with branching moieties. For instance, triethylene glycol, with a valence of two, can be converted to a platform with a valence of four by converting triethylene glycol to a bis-chloroformate derivative. Reaction of the bis-chloroformate with an appropriately substituted diethylenetriamine derivative provides a tetravalent platform, as illustrated in  
20 Example 6. Similarly, reaction of triethyleneglycol bis-chloroformate with iminodiacetic acid can provide a tetravalent platform terminated in carboxyl groups, as shown in Example 7.

Methods known in the art for making valency platform molecules, include, for  
25 example, a propagation method, or segmented approach. Such methods can be modified, using the appropriate reagents, to provide aminooxy groups on the resulting molecule. For example, reactive groups, such as halide groups, hydroxy groups, amino groups, aldehydes, ketones, or carboxyl groups, may be reacted to attach molecules, such as linkers, that comprise aminooxy groups that are optionally protected. Exemplary methods are demonstrated in the Examples herein.

30 The advantages of the use of valency platform molecules include the ease of synthesis, the ability to adjust the length and water solubility of the "arms" of the

valency platform by using, for example, different alkyleneoxy or dialcoholamine groups, and the ability to further attenuate the properties of the valency platform by choice of the core group.

5 In one aspect, valency platform molecules are provided that are substantially monodisperse. The aminoxy valency platform molecules advantageously have a narrow molecular weight distribution. A measure of the breadth of distribution of molecular weight of a sample of an aminoxy valency platform molecule is the polydispersity of the sample. Polydispersity is used as a measure of the molecular weight homogeneity or nonhomogeneity of a polymer sample. Polydispersity is  
10 calculated by dividing the weight average molecular weight ( $M_w$ ) by the number average molecular weight ( $M_n$ ). The value of  $M_w/M_n$  is unity for a perfectly monodisperse polymer. Polydispersity ( $M_w/M_n$ ) is measured by methods available in the art, such as gel permeation chromatography. The polydispersity ( $M_w/M_n$ ) of a sample of an aminoxy valency platform molecule is preferably less than 2, more preferably, less than 1.5, or less than 1.2, less than 1.07, less than 1.02, or, *e.g.*, about 1.05 to 1.5 or about 1.05 to 1.2. Typical polymers generally have a polydispersity of 2-5, or in some cases, 20 or more. Advantages of the low polydispersity property of the valency platform molecules include improved biocompatibility and bioavailability since the molecules are substantially homogeneous in size, and variations in  
15 biological activity due to wide variations in molecular weight are minimized. The low polydispersity molecules thus are pharmaceutically optimally formulated and easy to analyze. Further there is controlled valency of the population of molecules in the sample.

25 In some embodiments, the valency platform molecule may be described as "dendritic," owing to the presence of successive branch points. Dendritic valency platform molecules possess multiple termini, typically 4 or more termini, *e.g.*, 8 termini, or 16 termini.

Note that the Formulas disclosed herein are intended to encompass both "symmetric" and "non-symmetric" valency platforms. In one embodiment, the  
30 valency platform is symmetric. In another embodiment, the valency platform is non-symmetric.

### General Formulas

In one embodiment, provided are valency platform molecules comprising terminal aminooxy groups, for example, 1 to 100, *e.g.*, 1-50, 2-16, 4-16, or *e.g.*, 2, 3, 4, 8, 16, 32 or more aminooxy groups. In one embodiment, a valency platform molecule is provided that has at least 3 or 4 aminooxy groups, and optionally further comprises oxyalkylene groups, such as oxyethylene groups or polymers thereof.

In one embodiment, a valency platform molecule is provided, having the formula:

Formula 1

wherein:

*m* is 1 to 100, for example, 1-50, 1-16, 2-16, 4-16, or, *e.g.*, 2, 4, 8, 16, 32 or more, and in one embodiment is at least 3, *e.g.*, 3-50; and

*R* is an organic moiety, for example, comprising atoms, *e.g.*, 1 to 10,000 atoms, 1 to 1000 atoms, or *e.g.*, 1-100 atoms, including, for example, H, C, N, O, P, Si and S atoms, as well as halogen atoms. For example, *R* may include between 1 to 1000 or, *e.g.*, 1-100, C, H, N, and O atoms.

In another embodiment, the valency platform molecule has the formula:

Formula 2

wherein:

*y* is, for example, 1 to 100, *e.g.*, 1-50, 1-32, 1-16, 2-16, 4-16, or *e.g.*, 1, 2, 3, 4, 8, 16, 32 or more;

*n* is, for example, 1 to 100, *e.g.*, 1-50, 1-32, 1-16, 2-16, 4-16, or *e.g.*, 2, 3, 4, 8, 16, 32 or more;

wherein, in one embodiment, the product of *y* \* *n* (*y* multiplied by *n*) is at least 3; and

*R*<sup>c</sup> and each *G*<sub>1</sub> are independently organic moieties, for example, comprising atoms selected from the group of H, C, N, O, P, Si and S atoms, for example, less than 1000 atoms, 1,000 to 10,000 or more.

In one embodiment  $R^c$  is as defined below, and  $G_1$  is as  $G_2$  is defined below.  
In one embodiment, the molecule of Formula 2 comprises oxyalkylene groups.

In another embodiment, a valency platform molecule is provided, having one  
of the following formulas also shown in Figure 18:

Formula 3;

Formula 4;

Formula 5;

Formula 6;

Formula 7; or

Formula 8;

wherein, in one embodiment:

$y$  is 1 to 100, *e.g.*, 1-50, 1-32, 1-16, 2-16, 4-16, or *e.g.*, 1, 2, 3, 4, 6, 8, 16, 32, 64 or more;

$n$  is 1 to 100, *e.g.*, 1-50, 1-32, 1-16, 2-16, 4-16, or *e.g.*, 2, 3, 4, 6, 8, 16, 32, 64 or more;

wherein in one embodiment the product of  $y * n$  ( $y$  multiplied by  $n$ ) is at least 3;

$R^1$  if present is, for example, H, alkyl, heteroalkyl, aryl, heteroaryl, or optionally is  $-G_2(ONH_2)_n$  as defined herein; and

$R^c$  and each  $G_2$  are independently organic moieties, for example, comprising atoms selected from the group of H, C, N, O, P, Si and S atoms, or optionally halogen atoms, for example, 1 to 10,000, 1 to 1000 atoms, or 1 to 100 atoms.

$R^1$  thus can be, in one embodiment, any alkyl moiety including carbon and hydrogen groups, such as methyl, ethyl or propyl, or other hydrocarbon including

straight chain, branched or cyclic structures, which may be saturated or unsaturated, or may be a heteroalkyl group further comprising, for example O, S or N atoms, or may be an aryl or heteroaryl group.

In one embodiment,  $R^C$  and each  $G_2$  independently comprise, *e.g.*, a straight chain, branched or cyclic structure, and are independently selected from the group consisting of:

hydrocarbyl groups, consisting of only H and C atoms and having 1 to 5,000, 1-500, 1 to 200, 1 to 100, or, *e.g.*, 1 to 20 carbon atoms;

organic groups consisting only of carbon, oxygen, and hydrogen atoms, and having 1-5,000, 1 to 500, 1 to 200, 1 to 100, or, *e.g.*, 1 to 20 carbon atoms;

organic groups consisting only of carbon, oxygen, nitrogen, and hydrogen atoms, and having from 1-5,000, 1 to 500, 1 to 200, 1 to 100, or, *e.g.*, 1 to 20 carbon atoms;

organic groups consisting only of carbon, oxygen, sulfur, and hydrogen atoms, and having from 1 to 5,000, 1 to 500, 1 to 200, 1 to 100, or, *e.g.*, 1 to 20 carbon atoms; or

organic groups consisting only of carbon, oxygen, sulfur, nitrogen and hydrogen atoms and having from 1-5000, 1 to 500, 1 to 200, 1 to 100, or, *e.g.*, 1 to 20 carbon atoms.

In the Formulas,  $R^C$  denotes a "core group," that is, an organic group which forms the core of the valency platform, and to which one or more organic groups is attached. In one embodiment, the valency of the core group corresponds to  $y$ . If  $y$  is 1, then  $R^C$  is monovalent; if  $y$  is 2, then  $R^C$  is divalent; if  $y$  is 3, then  $R^C$  is trivalent; if  $y$  is 4, then  $R^C$  is tetravalent, and so on.

$R^C$  can be, *e.g.*, alkyl, heteroalkyl, aryl, heteroaryl, and can be, *e.g.*, straight chain, branched or cyclic.

In one embodiment,  $R^C$  is a hydrocarbyl group (*i.e.*, consisting only of carbon and hydrogen) having from 1-2000, or 1 to 200 carbon atoms, *e.g.*, 1 to 100 carbon atoms, or 1 to 50 carbon atoms.  $R^C$  may be, for example, linear or branched, for may

09590592-060800

comprise a cyclic structure. In one embodiment,  $R^C$  is cyclic.  $R^C$  may be saturated or fully or partially unsaturated.  $R^C$  may comprise or be an aromatic structure. In one embodiment,  $R^C$  is an aromatic group, such as a benzyl group having a valency, for example, of between 1 and 6.  $R^C$  may be, for example  $-\text{CH}_2-$ ;  $-\text{CH}_2\text{CH}_2-$ ;  $-\text{CH}_2\text{CH}_2\text{CH}_2-$ ; or  $\text{C}(\text{CH}_2-)_4$ .  $R^C$  further may be, for example,  $-(\text{CH}_2)_n-$ , wherein  $n$  is 1 to 20.

In one embodiment,  $R^C$  is an organic group consisting only of carbon, oxygen, and hydrogen atoms, and having, for example, from 1 to 5,000, 1 to 500, 1-200, 1 to 50, or 1-20 carbon atoms, or *e.g.*, 1 to 10 carbon atoms, or 1 to 6 carbon atoms.  $R^C$  may be or comprise an alkoxy group. In one embodiment,  $R^C$  is, comprises or is derived from a polyoxyalkylene group, such as a polyoxyethylene group or polyoxypropylene group.  $R^C$  may be or comprise a divalent polyoxyalkylene group, such as a divalent polyoxyethylene or polyoxypropylene group. In one embodiment,  $R^C$  is or comprises a divalent polyoxypropylene group, for example, including about 1-5,000, 1 to 500, 1-200, 1-100 or 1-50 oxypropylene units, or, *e.g.*, 1-20, 1-10, or 1, 2, 3, 4, or 5 oxypropylene units. In another embodiment,  $R^C$  is or comprises a divalent oxyethylene group, for example including about 1 to 5,000, 1 to 500, 1-200, 1-100 or 1-50 oxyethylene units, or *e.g.*, 1-20, 1-10, or 1, 2, 3, 4, or 5 oxyethylene units.

In one embodiment,  $R^C$  is:

wherein  $p$  is a positive integer from 2 to about 500, *e.g.*, 2-200, *e.g.* 2 to about 50, 2 to about 20, 2 to about 10, or 2 to about 6. In one embodiment,  $p$  is 2, 3, 4, 5 or 6.

In one embodiment,  $R^C$  is an organic group consisting only of carbon, oxygen, nitrogen, and hydrogen atoms, and having from 1 to 5,000, 1 to 500, *e.g.* 1-200 or 1 to 20 carbon atoms, *e.g.*, 1 to 10 carbon atoms, or 1 to 6 carbon atoms. Examples of

such core groups include, but are not limited to those which consist only of carbon, oxygen, nitrogen, and hydrogen atoms.

In one embodiment,  $R^C$  is an organic group consisting only of carbon, oxygen, sulfur, and hydrogen atoms, and having from 1 to 5,000, 1 to 500, or 1 to 200 carbon atoms, *e.g.* 1 to 100 carbon atoms, or 1 to 10 carbon atoms.

$R^C$  may be, for example, a C1-200 hydrocarbon moiety; a C1-200 alkoxy moiety; or a C1-200 hydrocarbon moiety comprising an aromatic group.

$R^C$  may be or comprise an alcohol containing core compounds having two hydroxyl groups, such as ethylene glycol, diethylene glycol (also referred to as DEG), triethylene glycol (also referred to as TEG), tetraethylene glycol, pentaethylene glycol, hexaethylene glycol, polyethylene glycol (also referred to as PEG), where *n* is typically from 1 to about 200, and 1,4-dihydroxymethylbenzene. Examples of alcohol containing core compounds having three hydroxyl groups include phluoroglucinol (also known as 1,3,5-trihydroxybenzene), 1,3,5-trihydroxymethylbenzene, and 1,3,5-trihydroxycyclohexane. Examples of alcohol containing core compounds having four hydroxyl groups include pentaerythritol.

In the Formulas,  $G_2$  can denote an organic "linker group."  $G_2$  in one embodiment is or comprises an organic group, such as alkyl, heteralkyl, aryl, or heteroaryl, and may be, or may contain, *e.g.*, a straight chain, branched or cyclic structure.  $G_2$  may, for example, comprise hydrocarbyl, ethyleneoxy, polyethyleneoxy, propyleneoxy or polypropyleneoxy groups, or combinations thereof.  $G_2$  optionally may comprise other heteroatoms including S and N.

$G_2$  also may comprise functional groups such as amine, amide, ester, ether, ketone, aldehyde, carbamate and thioether.  $G_2$  also may comprise functional groups such as primary secondary and tertiary, saturated or unsaturated alkyl amine groups, such as piperazinyl or piperidinyl groups.  $G_2$  also may comprise functional groups including polyalcohol, polyamine; polyether; hydrazide; hydrazine; carboxylic acid; anhydride; halo; sulfonyl; sulfonate; sulfone; imidate; cyanate; isocyanate; isothiocyanate; formate; thiol; alcohol; oxime; imine; aminooxy; and maleimide.

In one embodiment,  $G_2$  is a hydrocarbyl group (*i.e.*, consisting only of carbon and hydrogen) comprising 1 to 5,000, 1 to about 500 or 1 to about 200 carbon atoms,

*e.g.*, 1 to 100 carbon atoms, or 1 to 10 carbon atoms. In one embodiment,  $G_2$  is or comprises an alkyl group, *e.g.*,  $-(CH_2)_q-$  wherein  $q$  is 1 to 20. In one embodiment,  $G_2$  is or comprises a linear, branched, or cyclic structure.  $G_2$  may be fully or partially unsaturated or saturated. In one embodiment,  $G_2$  comprises an aromatic structure. In one embodiment,  $G_2$  is aromatic. In one embodiment,  $G_2$  is divalent. In one embodiment,  $G_2$  is or comprises  $-(CH_2)_q-$  wherein  $q$  is from 1 to about 20, *e.g.*, 1 to about 10, or 1 to about 6, or 1 to about 4. In one embodiment,  $G^1$  is  $-CH_2-$ . In one embodiment,  $G_2$  is or comprises  $-CH_2CH_2-$ . In one embodiment,  $G_2$  is or comprises  $-CH_2CH_2CH_2-$ .

In one embodiment,  $G_2$  is an organic group consisting only of carbon, oxygen, and hydrogen atoms, and having from 1 to 5,000, 1 to 500, 1 to 200, 1 to 50, *e.g.*, 1-20 carbon atoms, or *e.g.*, from 1 to 10 carbon atoms, or from 1 to 6 carbon atoms. In one embodiment,  $G_2$  is derived from a polyoxyalkylene group. In one embodiment,  $G_2$  is or comprises a divalent polyoxyalkylene group. In one embodiment,  $G_2$  is or comprises a divalent polyoxyethylene group. In one embodiment,  $G_2$  is a divalent polyoxypropylene group. In one embodiment,  $G_2$  is or comprises:

wherein  $p$  is from 2 to about 200 or 500, *e.g.*, from 2 to about 50, or from 2 to about 20, or from 2 to about 10, or from 2 to about 6. In one embodiment,  $p$  is 2, 3, 4, 5 or 6.

In one embodiment,  $G_2$  is an organic group consisting only of carbon, oxygen, nitrogen, and hydrogen atoms, and having from 1 to 5,000, 1 to 500, *e.g.*, 1 to 200 carbon atoms, *e.g.*, from 1 to 100 carbon atoms, or from 1 to 10 carbon atoms.

$G_2$  may be, for example, a C1-200 hydrocarbon moiety; a C1-200 alkoxy moiety; or a C1-200 hydrocarbon moiety comprising an aromatic group.

In one embodiment the valency platform molecules have any one of the Formulas 9 - 13 shown in Figure 19. In Formulas 9-13, in one embodiment,  $R_c$  and

G<sub>2</sub> are as defined above, and n is about 1-500, *e.g.*, 1-200, 1-100, or 1-50, *e.g.*, 1-20, 1-10, or *e.g.*, 1, 2, 3, 4 or 5. In one embodiment, G<sub>2</sub>-ONH<sub>2</sub> has any of the structures shown in Figure 17.

In a further embodiment the valency platform molecules have any of the structures shown in Figures 20, 21 and 22.

In one preferred embodiment of each of the compounds and formulas disclosed herein, the valency platform molecule comprises aminooxy groups that are aminooxyalkyl groups, *e.g.*, -CH<sub>2</sub>CH<sub>2</sub>ONH<sub>2</sub>.

#### Preparation of Molecules Comprising Aminooxy Groups

A variety of molecules may be modified to comprise reactive aminooxy groups as disclosed herein. For example, a wide variety of polymers, such as poly(alkyleneoxide) polymers, including poly(ethyleneoxide) polymers, and in particular, polyethylene glycols, having a molecular weight, for example, less than 10,000 Daltons, can be modified to contain aminooxy groups.

Other molecules that can be modified to include aminooxy groups include branched, linear, block, and star polymers and copolymers, for example those comprising poly(alkyleneoxide) moieties, such as poly(ethylene oxide) molecules. In a preferred embodiment, polyethylene glycol molecules are provided that include at least three aminooxy groups, and optionally have a molecular weight less than about 10,000.

In one aspect, valency platform molecules may be modified to comprise aminooxy groups. Methods for making valency platform molecules are described, for example, in U.S. Patents Nos. 5,162,515; 5,391,785; 5,276,013; 5,786,512; 5,726,329; 5,268,454; 5,552,391; 5,606,047; 5,663,395 and 5,874,409, as well as in U.S. Serial No. 60/111,641 and PCT US97/10075.

Methods known in the art for making valency platform molecules, include, for example, a propagation method, or segmental approach. Such methods can be modified, using the appropriate reagents, to provide aminooxy groups on the resulting molecule. For example, reactive groups, such as halide groups or hydroxy groups may be reacted to attach molecules, such as linkers, that comprise aminooxy groups

that are optionally protected. Exemplary methods are demonstrated in the Examples herein.

The valency platforms can be prepared from a segmental approach in which segments are independently synthesized and subsequently attached to a core group. An alternative to the segmental approach is the core propagation process which is an iterative process that may be used to generate a dendritic structure.

Examples of core compounds include alcohol containing core compounds methanol, ethanol, propanol, isopropanol, and methoxypolyethylene glycol, mono-hydroxylamines, ethylene glycol, diethylene glycol, triethylene glycol, tetraethylene glycol, pentaethylene glycol, hexaethylene glycol, 1,4-bis-(hydroxymethyl)benzene and polyethylene glycol  $\text{HO}(\text{CH}_2\text{CH}_2\text{O})_n\text{H}$ , wherein, for example,  $n$  is about 1-500 or 1-200, *e.g.*, 1-10, or 1 to 5, or primary or secondary amines having two hydroxyl groups.

Aminooxy platforms can be prepared for example to provide a valence of four. Valency Platform molecules of Formula 2 may be prepared as demonstrated in the Examples, *e.g.*, in Example 9. The molecules may be prepared from a tetravalent valency platform molecule with terminal groups which can be converted to aminooxy groups. In general, good leaving groups such as halide or sulfonate, which can be displaced with the oxygen of a protected hydroxylamine derivative, can be used. Also hydroxyl groups can be converted to aminooxy groups using oxaziridine type reagents or Mitsunobu chemistry. In this example a tetra-alkyl halide platform is prepared, and the halide is displaced with the oxygen atom of *N*-(*tert*-butyloxycarbonyl)hydroxylamine. Removal of the Boc (*N*-(*tert*-butyloxycarbonyl)) protecting groups provides an aminooxy platform.

Other examples involve preparing a suitably protected alkoxyamine bifunctional linker which is attached to the terminal group of a platform. Valency platform molecules of Formula 3 may be prepared by methods described in the Examples, for example, as described in Example 3, from a valency platform molecule which terminates in hydroxyl groups. The hydroxyl groups are converted to an activated carbonate. A bivalent linker is prepared which has a free amino group and a protected aminooxy group. The linker is joined to the platform by reaction of the free

amino group with the carbonate ester to form a carbamate linkage, and the protecting group is removed from the aminooxy group to liberate the aminooxy platform.

Valency platform molecules of Formula 4 may be made, for example, via methods described in detail in the Examples, *e.g.* in Example 7, from a valency platform molecule that terminates in carboxyl groups. A bivalent linker is prepared which has a free amino group and a protected aminooxy group. The carboxyl groups are activated, and the linker is joined to the platform by reaction of the free amino group with the activated carboxyl group to form an amide linkage. The protecting group is removed from the aminooxy group to liberate the aminooxy platform.

Valency platform molecules of Formula 5 may be made, for example, via methods described in detail in the Examples, *e.g.*, as described in Example 2, from a valency platform molecule that terminates in amino groups. A bivalent linker is prepared which has an activated carboxyl group and a protected aminooxy group. The amino groups on the platform are reacted with the activated carboxyl group on the linker to form an amide linkage. The protecting group is removed from the aminooxy group to liberate the aminooxy platform.

Valency platform molecules of Formula 6 may be made, for example, via methods described in detail in the Examples, *e.g.* as described in Examples 4 and 6, from a valency platform molecule that terminates in amino groups. A bivalent linker is prepared which has an activated carbonate group and a protected aminooxy group. The amino groups on the platform are reacted with the activated carbonate group on the linker to form carbamate linkage. The protecting group is removed from the aminooxy group to liberate the aminooxy platform.

Valency platform molecules of Formula 7 may be made, for example, via methods described in detail in the Examples, *e.g.* as described in Example 8, from a valency platform molecule that terminates in aldehyde or ketone groups. A bivalent linker is prepared which has two free aminooxy groups. The aldehyde or ketone groups on the platform (ketones in example 8) are reacted with an excess of the bivalent bis-aminooxy linker to provide the aminooxy platform.

Valency platform molecules of Formula 8 may be made, for example, via methods described in detail in the Examples, *e.g.* as described in Examples 5a and 5b

from a valency platform molecule that terminates in alkyl halide groups. In the examples provided, reactive haloacetyl groups are used. A bivalent linker is prepared which has a free thiol and a protected aminooxy group. The halides (or other suitable leaving groups) on the platform are reacted with the free thiol on the linker to form a thioether linkage. The protecting group is removed from the aminooxy group to liberate the aminooxy platform.

As shown in Figure 34, in one embodiment a bPEG 8-mer platform, M is synthesized by a process wherein a tetrameric PNP carbonate ester (compound 50a) is reacted with compound 133 resulting in the formation of compound K. The Boc-protecting groups are removed from compound K, and the resulting octa-amine is treated with compound 106 resulting in the formation of compound L. Removal of the Boc-protecting groups from compound M results in the formation of compound M.

In another embodiment, a tetravalent aminooxy platform with two PEG chains attached is synthesized as shown in Figure 35 from intermediate 122 which has two PEG chains attached. Thus compound 122 is reacted with NHS ester O (Shearwater Polymers) to form platform P. "PEG" or "polyethylene glycol" or "polyethylene oxide" are used interchangeably herein to refer to polymers of ethylene oxide.

#### Conjugates, Methods of Preparation, and Uses Thereof

Aminooxy groups on molecules such as polyoxyethylene polymers and a variety of valency platform molecules provide reactive groups to which one or more molecules, such as biologically active molecules, may be covalently tethered to form a conjugate.

The term "biologically active molecule" is used herein to refer to molecules which have biological activity, preferably *in vivo*. In one embodiment, the biologically active molecule is one which interacts specifically with receptor proteins. The biologically active molecule may be, *e.g.*, a polypeptide or a nucleic acid. Depending on the valency of the platform, the platform molecule conjugate may include 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12 or more biologically active molecules, or *e.g.*, 16, 18, 32, 36 or more.

Conjugates may be used in a method for treating an antibody mediated disease or other condition in an individual in need of such treatment comprising administering to the individual an effective amount of the conjugates. Conjugates also may be used in a method of inducing specific B cell anergy to an immunogen in an individual comprising administering to the individual an effective amount of the conjugates. The conjugates also may be used in a method of treating an individual for an antibody-mediated pathology in which undesired antibodies are produced in response to an immunogen comprising administering to the individual an effective amount of the conjugates.

In one embodiment, it is preferred that the total molecular weight of the conjugate is no greater than about 200,000 Daltons, for example, in order for the conjugate to be effective as a functional toleragen.

In one embodiment, the biologically active molecule is a domain 1 polypeptide of  $\beta_2$ GPI, as described, *e.g.*, in U.S. Serial No. 60/103,088; in U.S. Serial No. 09/328,199, filed June 8, 1999; and in PCT US99/13194, published December 16, 1999, the disclosures of which are incorporated herein. The domain 1 conjugates can be used in methods for detection of a  $\beta_2$ GPI-dependent antiphospholipid antibody (or an antibody that specifically binds to a domain 1  $\beta_2$ GPI polypeptide(s)) in a sample by contacting antibody in the sample with the conjugate under conditions that permit the formation of a stable antigen-antibody complex; and detecting stable complex formed if any. The conjugates also can be used in methods of inducing tolerance in an individual which comprise administering an effective amount of a conjugate to an individual, particularly a conjugate comprising a domain 1  $\beta_2$ GPI polypeptide(s) that lacks a T cell epitope, wherein an effective amount is an amount sufficient to induce tolerance.

In another embodiment, there is provided a conjugate of a valency platform molecule and at least one  $\alpha$ Gal epitope or analog thereof that specifically binds to an anti- $\alpha$ Gal antibody. In another aspect, a method of reducing circulating levels of anti- $\alpha$ Gal antibodies in an individual is provided comprising administering an effective amount of the conjugate to the individual, wherein an effective amount is an

amount sufficient to reduce the circulating levels of anti- $\alpha$ Gal antibodies; or to neutralize circulating levels of anti- $\alpha$ Gal antibodies. In another aspect, a method of inducing immunological tolerance (generally to a xenotransplantation antigen, more specifically to  $\alpha$ Gal), is provided, the method comprising administering an effective amount of the conjugate comprising the  $\alpha$ Gal epitope or analog thereof. The conjugates also can be used to detect the presence and/or amount of anti- $\alpha$ Gal antibody in a biological sample. Methods of performing a xenotransplantation in an individual also are provided, comprising administering a conjugate to the individual; and introducing xenotissue to the individual. In another aspect, methods of suppressing rejection of a transplanted tissue are provided comprising administering the conjugate to the individual in an amount sufficient to suppress rejection. These methods are described generally in PCT US99/29338.

The conjugates also may be used for immunotolerance treatment of lupus optionally based on assessment of initial affinity of antibody from the individual (i.e., antibody associated with lupus, namely, anti double stranded DNA antibodies) and used as a basis for selecting the individual for treatment, or in methods of identifying individuals suitable (or unsuitable) for treatment based on assessing antibody affinity. Methods of treating systemic lupus erythematosus (SLE) in an individual comprise administering to the individual a conjugate comprising (a) a non-immunogenic valency platform molecule and (b) two or more polynucleotides which specifically bind to an antibody from the individual which specifically binds to double stranded DNA. These methods are described generally in PCT US99/29336.

Thus, the valency platform may be covalently linked to form a conjugate with one or more biologically active molecules including oligonucleotides, peptides, polypeptides, proteins, antibodies, saccharides, polysaccharides, epitopes, mimotopes, enzymes, hormones and drugs, lipids, fatty acids, or mixtures thereof to form a conjugate.

The terms "protein", "polypeptide", and "peptide" are used interchangeably herein to refer to polymers of amino acids of any length. The polymer may be linear or branched, it may comprise modified amino acids, and it may be interrupted by non-amino acids. It also may be modified naturally or by intervention; for example,

disulfide bond formation, glycosylation, myristylation, acetylation, alkylation, phosphorylation or dephosphorylation. Also included within the definition are polypeptides containing one or more analogs of an amino acid (including, for example, unnatural amino acids) as well as other modifications known in the art.

5 One advantage of the conjugates of valency platforms and other molecules comprising aminooxy groups is the ability to introduce enhanced affinity of the tethered biologically active molecules for their binding partners, for example when the binding partners are associated in a cluster. The covalent attachment of plural biological molecules to the valency platform molecule provides an enhanced local concentration of the biomolecules as they are associated together for example on the platform molecule. Another advantage of the valency platforms is the ability to facilitate binding of multiple ligands, as is useful in B cell tolerance. For example, the conjugates can be used as toleragens to present multivalent epitopes to induce clustering on the surface of a B cell. Another advantage of the valency platforms is the ability to include functionality on the "core" that can be independently modified to enable the preparation of conjugates which can be tailored for specific purposes.

10 In general a molecule comprising an aminooxy group is reacted with a second molecule comprising a carbonyl group, such as an aldehyde or ketone, to form an oxime conjugate. The second molecule may be modified to contain the reactive aldehyde or ketone. The oxime bond can be further modified. For example, it may be converted to an aminooxy bond via reduction or reaction with nucleophiles by known methods to form an aminooxy conjugate.

15 In one embodiment, a method of preparing chemically defined multivalent conjugates of native polypeptides or proteins with multivalent preferably non-immunogenic valency platform molecules comprising aminooxy groups is provided, wherein, if needed, the polypeptide is selectively modified to generate an aldehyde or ketone moiety at a specific position on the polypeptide. The polypeptide then is reacted with the multivalent valency platform molecule which contains aminooxy groups to form one or more oxime linkages between the platform and the polypeptide.

Amines, for example at the N-terminus, of virtually any polypeptide or other molecule can be converted to an aldehyde or a ketone by a reaction which is known in the art as a transamination reaction. Essentially, the transamination reaction converts the carbon-nitrogen single bond to a carbon oxygen double bond. For example, a glycine at the N-terminus can react to form a glyoxyl group, an aldehyde, as shown in Figure 1. Most other amino acids react to form a ketone by virtue of the amino acid side chain.

Another way to generate an glyoxyl group at the N-terminus is to oxidize an N-terminal serine or threonine with sodium periodate. This oxidation cleaves the carbon-carbon bond between the hydroxyl and amino groups of the N-terminal serine or threonine providing a glyoxyl group. Thus in one embodiment, polypeptides can be site specifically modified by forming a ketone or aldehyde at the N-terminus. Synthetic polypeptides and other drugs or biologically active molecules can be modified similarly to include aldehydes or ketones which can be used to form oxime linkages.

Multivalent platforms containing aminooxy reactive groups permit covalent attachment of the selectively modified polypeptides to the platforms. The valency platform molecule may comprise, *e.g.*, aminooxyacetyl groups or aminooxyalkyl groups.

As used herein, an "aminooxyacetyl group" refers to an aminooxy group with an alpha carbonyl, such as  $-\text{COCH}_2\text{-ONH}_2$ , while an "aminooxyalkyl group" refers to an aminooxy group on a first carbon, wherein the first carbon is preferably not directly attached to an electron withdrawing group, such as a second carbon which is part of a carbonyl group. One preferred aminooxyalkyl group is  $-\text{CH}_2\text{-CH}_2\text{-ONH}_2$ . Other embodiments of aminooxyalkyl groups include  $-\text{CH}(\text{OH})\text{CH}_2\text{ONH}_2$ , and  $-\text{CH}_2\text{CH}(\text{CH}_3)\text{ONH}_2$ .

Aminooxyacetyl (AOA) groups can be attached to multivalent platforms containing amine groups by acylation with a N-protected aminooxyacetyl group followed by protecting group removal. Reaction of glyoxyl polypeptides with aminooxyacetyl groups proceeds slowly to form oxime linkages between the polypeptide and the aminooxy functionalized platform. The long reaction times

necessary for the reaction can permit competing side reactions to occur. N-terminal  $\alpha$ -keto-amides, which are formed with the transamination of N-terminal amino acids other than glycine, react even more slowly or not at all to make multivalent conjugates.

5           Aminooxyalkyl groups (AO alkyl groups) are preferred and react more readily with ketones and aldehydes to form oximes than aminooxyacetyl groups. An aminooxy group on an alkyl chain (for example, a triethylene glycol chain) is, for example, more than ten times more reactive in forming oximes than an analogous aminooxyacetyl group. The aminooxyacetyl group is generally less reactive than  
10       other aminooxy groups (aminooxyalkyl groups) which are not adjacent to a carbonyl. It is believed that the carbonyl of the aminooxyacetyl group lowers reactivity due to electron withdrawing effects.

15           In one embodiment, terminal aminooxyalkyl groups that can react with glyoxyl-polypeptides on platforms are provided that are designed with enhanced reactivity toward oxime formation. In one embodiment, the aminooxy groups are provided on triethylene glycol or hexyl chains; however any other chain is possible including those comprising carbon, oxygen, nitrogen or sulfur atoms. In one preferred embodiment, the aminooxy groups in the platform molecule are aminooxyalkyl groups, such as  $-\text{CH}_2\text{CH}_2\text{ONH}_2$ .

20           Examples of attachment of biomolecules with aldehyde or ketone functionality to aminooxy platforms via oxime bond formation are provided in the Examples. Examples 10 and 11 describe how transaminated polypeptides, or polypeptides otherwise modified with aldehyde or ketone groups, are reacted with aminooxy platforms. In these cases transaminated Domain 1 is attached to tetravalent  
25       platforms by treating the platforms with the glyoxyl-polypeptide in acidic aqueous solution. A preferred acidic condition is 100 mM pH 4.6 sodium acetate. In the case of making a tetravalent Domain 1 conjugate, an excess of four equivalents, for example six equivalents, of transaminated Domain 1 is used. Aminooxyalkyl reactive groups are more reactive than aminooxyacetyl groups, allowing the reaction  
30       to take place more readily with the opportunity for fewer byproducts. Example 10

describes conjugate formation with an aminooxyacetyl platform. Example 11 describes conjugate formation with an aminooxyalkyl platform.

Two alternative methods of preparing tetravalent Domain 1 conjugates are shown in Examples 13 and 14. Both of these examples involve attaching a linker to transaminated Domain 1 via an oxime bond, then using the linker to attach to a platform with suitable reactive groups. The advantage of attaching the linker to transaminated Domain 1 first is that excess linker can be added to drive the oxime forming reaction to completion.

Example 13 describes how a bis-aminooxy linker is attached to Domain 1 first, then the polypeptide with aminooxy linker attached is reacted with a ketone derivatized platform to provide the desired tetravalent conjugate.

Example 14 demonstrates how a heterobifunctional linker can be used to attach a thiol linker to Domain 1 via an oxime bond. Domain 1 with the thiol linker attached is then reacted with a reactive alkyl halide platform to provide a tetravalent conjugate.

It is apparent that the conjugates formed in Examples 13 and 14 are the same conjugates which would be formed if the linkers were attached first to the platform, followed by conjugation with transaminated Domain 1.

The disclosures of all publications, patents, patent applications and published patent applications referred to herein by an identifying citation are hereby incorporated herein by reference in their entirety.

The invention will be further understood by the following nonlimiting examples.

## EXAMPLES

In the following examples, the following abbreviations are used: DCC, 1,3-dicyclohexylcarbodiimide; DIC, 1,3-diisopropylcarbodiimide; DBU, 1,8-diazabicyclo[5.4.0]undec-7-ene; NHS, N-hydroxysuccinimide; HOBt, 1-hydroxybenzotriazole; DMF, dimethylformamide;

### Example 1 - Transamination of Domain 1

Synthesis of Transaminated Domain 1 (TA/D1): Water and sodium acetate buffer were sparged with helium before use. The domain 1 polypeptide of  $\beta$ 2GPI was used, which is described in U.S. Serial No. 60/103,088, filed October 5, 1998; in U.S. Serial No. 09/328,199, filed June 8, 1999; and in PCT US99/13194, the disclosures of which are incorporated herein. The Domain 1 polypeptide, as illustrated in Figure 1, has an N-terminal glycine. Domain 1 (10.55 mg, 1.49  $\mu$ mol) was dissolved in 0.5 mL of H<sub>2</sub>O in a polypropylene tube, and 4.0 mL of 2 M pH 5.5 NaOAc buffer was added. A solution of 3.73 mg (14.9  $\mu$ mol) of CuSO<sub>4</sub> in 0.5 mL of H<sub>2</sub>O was added to the mixture, followed by a solution of 2.75 mg (29.9  $\mu$ mol) of glyoxylic acid in 0.5 mL of 2 M pH 5.5 NaOAc buffer. The mixture was kept under nitrogen atmosphere and agitated gently for 18 h at which time the reaction appeared complete by analytical HPLC using a 4.6 mm x 250 mm, 300 Å, 5  $\mu$ m, diphenyl column (Vydac, Hesperia, CA) with detection at 280 nm (1 mL/min; gradient 25%-45% B, 0-20 min, A = 0.1% TFA/H<sub>2</sub>O, B = 0.1% TFA/CH<sub>3</sub>CN). Approximate retention times are as follows: D1, 13.2 min; TA/D1, 13.7 min; oxidized TA/D1, 13.4 min). The mixture was diluted to a volume of 20 mL with 0.1% TFA/H<sub>2</sub>O, filtered, and purified by HPLC (22.4 mm X 250 mm, 300 Å, 10  $\mu$ m, diphenyl column (Vydac) (12 mL/min; gradient 25%-40% B, 0-40 min, A = 0.1% TFA/H<sub>2</sub>O, B = 0.1% TFA/CH<sub>3</sub>CN). Fractions containing pure TA/D1, as evidenced by analytical HPLC, were pooled and lyophilized to provide 5.0 mg (48%) of TA/D1. The reaction scheme is shown in Figure 1.

Example 2 - Synthesis of an aminooxyacetyl/PITG Platform

The synthetic scheme is shown in Figure 2.

4-Nitrophenyl -N-(tert-butyloxycarbonyl)aminooxyacetate, 2: To a stirred solution of 1.5 g (7.85 mmol) of N-(tert-butyloxycarbonyl)aminooxyacetic acid (Aldrich Chemical Co., St. Louis, MO), compound 1, in 35 mL of anhydrous THF at 0°C was added 1.09 g (7.85 mmol) of 4-nitrophenol followed by 1.62 g (7.85 mmol) of DCC. The mixture was stirred under a nitrogen atmosphere for 0.5 h at 0°C and at room temperature for 18 h. The mixture was filtered to remove dicyclohexylurea, and the filtrate was concentrated and purified by silica gel chromatography (95/5 CHCl<sub>3</sub>/isopropyl alcohol) to give 2.30 g (94%) of compound 2 as a white solid: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.51 (s, 9H), 4.73 (s, 2H), 7.36 (d, 2H), 7.73 (s, 1H), 8.32 (d, 2H).

Synthesis of Boc-protected aminooxyacetyl/PITG Platform, 4: Compound 3 (300 mg, 0.235 mmol (prepared as described in PCT/US97/10075) was treated with 1.5 mL of a 30% solution of HBr in acetic acid for 30 min. The HBr salt of the resulting tetra-amine was precipitated by addition of diethyl ether. The mixture was centrifuged, and the supernatant was removed and discarded. The remaining solid was washed with ether, dried under vacuum, and dissolved in 9 mL of DMF. To the resulting mixture was added 294 μL (1.69 mmol) of diisopropylethylamine followed by a solution of 410 mg (1.31 mmol) of compound 2 in 3 mL of DMF. The mixture was stirred under nitrogen atmosphere for 4 h and partitioned between 15/1 CHCl<sub>3</sub>/MeOH and brine. The aqueous layer was washed twice with 15/1 CHCl<sub>3</sub>/MeOH, and the combined organic layers were dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated to give 680 mg of an oil. Purification by silica gel chromatography (step gradient 95/5 to 75/25 CHCl<sub>3</sub>/MeOH) gave 215 mg (65%) of compound 4 as a white solid: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.49 (s, 36H), 3.40-3.73 (m, 40H), 4.24(m, 12H), 4.59 (overlapping singlets, 8H), 8.21 (s, 2H), 8.32 (s, 2H).

Aminooxyacetyl/PITG Platform, Compound 5: HCl gas was bubbled through a stirred solution of 67 mg (.047 mmol) of compound 4 in 10/1/1 EtOAc/CHCl<sub>3</sub>/MeOH for 15 min, and the mixture was stirred for an additional 15 min. The mixture was concentrated under vacuum and kept under vacuum for 16 h to provide 43 mg (78%) of compound 5 as a white solid: <sup>1</sup>H NMR (DMSO) δ 3.33-3.67

(m, 40H), 4.08 (m, 4H), 4.18 (s, 8H), 4.90 (s, 8H); mass spectrum (ES) m/z calculated for  $C_{40}H_{69}N_{14}O_{18}$  (M+H): 1033. Found: 1033.

### Example 3 - Synthesis of AOTEG/DEA/DEG Platform

The synthetic scheme is shown in Figure 3.

2-[2-(2-iodoethoxy)ethoxy]ethanol, 7: 2-[2-(2-Chloroethoxy)ethoxy]ethanol (Aldrich Chemical Co.) (12.66 g, 75.1 mmol) and sodium iodide (33.77 g, 225.3 mmol) were dissolved in 250 mL of acetone. A reflux condensor was attached to the flask, and the mixture was heated at reflux for 18 h. When cool, the mixture was concentrated, and the residue was shaken with 400 mL of  $CH_2Cl_2$  and a mixture of 300 mL of water and 100 mL of saturated aqueous sodium bisulfite solution. The aqueous layer was washed twice with 400 mL portions of  $CH_2Cl_2$ , and the combined  $CH_2Cl_2$  layers were dried ( $MgSO_4$ ), filtered, and concentrated to provide 18.3 g (94%) of 7 as a light yellow oil which was used in the next step without further purification:  $^1H$  NMR ( $CDCl_3$ )  $\delta$  2.43 (brd s, 1H), 3.28 (t, 2H), 3.61 (m, 2H), 3.68 (s, 4H), 3.78 (m, 4H); mass spectrum (ES) m/z calculated for  $C_6H_{13}O_3INa$  (M+Na): 283.0. Found: 283.0.

2-[2-(2-N-(tert-butyloxycarbonyl)aminooxyethoxy)ethoxy]ethanol, 8: To 5.85 g (1.50 mmol) of 2-[2-(2-iodoethoxy)ethoxy]ethanol, compound 7, was added 2.00 g (1.00 mmol) of N-(tert-butyloxycarbonyl)hydroxylamine (Aldrich Chemical Co.) and 3.36 mL (3.42 g, 1.50 mmol) of DBU. The mixture was stirred to give a viscous liquid that became hot to the touch and placed in a 55°C oil bath for 18 h resulting in the formation of a white precipitate which solidified the mixture. The mixture was dissolved in 20 mL of  $CH_2Cl_2$  and added to 500 mL of stirred EtOAc resulting in the formation of a precipitate which was removed by filtration, and the filtrate was concentrated to give a brown-yellow oil. Purification by flash chromatography (50% acetone/hexane) to give 2.61 g (67%) of 8 as an oil:  $^1H$  NMR ( $CDCl_3$ )  $\delta$  1.50 (s, 9H), 3.65 (t, 2H), 3.70 (brd s, 4H), 3.76 (m, 4H), 4.06 (t, 2H), 7.83 (brd s, 1H);  $^{13}C$  NMR ( $CDCl_3$ )  $\delta$  28.0, 61.3, 68.9, 70.1, 70.3, 72.5, 72.6, 75.1, 81.2, 157.1.

2-[2-(2-N-(tert-butyloxycarbonyl)aminooxyethoxy)ethoxy]ethylbromide,

compound 9: Bromine (approximately 0.283 mmol) was added dropwise to a solution of 50 mg (0.188 mmol) of compound 8, 74 mg (0.283 mmol) of triphenylphosphine, and 31  $\mu$ L (30 mg, 0.377 mmol) of pyridine in 2 mL of  $\text{CH}_2\text{Cl}_2$  until an orange color persisted. The mixture was stirred at room temperature for 0.5 h, and 1 mL of a saturated solution of sodium bisulfite was added to quench excess bromine. The mixture was then partitioned between 10 mL of  $\text{H}_2\text{O}$  and 2 x 15 mL of EtOAc. The combined organic layers were washed with brine, dried ( $\text{Na}_2\text{SO}_4$ ), filtered, and concentrated. Purification of the residue by silica gel chromatography (35/65 acetone/hexane) provided 54 mg of compound 9 as an oil:  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  1.49 (s, 9H), 3.48 (t, 2H), 3.68 (s, 4H), 3.73 (m, 2H), 3.84 (t, 2H), 4.03 (t, 2H), 7.50 (s, 1H);  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ )  $\delta$  28.3, 30.4, 69.4, 70.6 (two signals), 71.3, 75.5, 81.7, 156.9.

2-[2-(2-N-(tert-butyloxycarbonyl)aminooxyethoxy)ethoxy]ethylazide, 10:

Synthesis from compound 9: A solution of 100 mg (0.305 mmol) of compound 9 in 0.25 mL of anhydrous DMF was added to a solution of 159 mg (2.44 mmol) of sodium azide in 0.5 mL of anhydrous DMF. An additional 0.25 mL of DMF was used to rinse residual 9 into the reaction mixture, and the mixture was heated at  $115^\circ\text{C}$  for 3 h. When cool, the mixture was partitioned between 3 mL of  $\text{H}_2\text{O}$  and 4 x 3 mL of  $\text{CH}_2\text{Cl}_2$ . The combined organic layers were washed with 10 mL of  $\text{H}_2\text{O}$ , dried ( $\text{Na}_2\text{SO}_4$ ), filtered, and concentrated to provide a yellow oil. Purification by silica gel chromatography (35/65 acetone/hexane) gave 67 mg (76%) of 10 as an oil:  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  1.47 (s, 9H), 3.41 (t, 2H), 3.69 (brd s, 4H), 3.73 (m, 4H), 4.03 (t, 2H), 7.50 (s, 1H);  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ )  $\delta$  28.1, 50.5, 69.1, 70.1, 70.4 (two signals), 75.2, 81.3, 156.7.

Synthesis of 10 from compound 13: To a solution of 258 mg (0.69 mmol) of compound 13 in 5 mL of DMF under nitrogen atmosphere was added 358 mg (5.50 mmol) of sodium azide. The mixture was stirred for 18 hours at room temperature, 100 mL of water was added, and the mixture was extracted with 3 x 50 mL of EtOAc. The EtOAc layers were combined and washed with 50 mL of water, dried ( $\text{Na}_2\text{SO}_4$ ), filtered, and concentrated to provide 294 mg of a colorless oil. Purification by silica

gel chromatography (30/70 acetone/hexanes) provided compound 10 as a colorless oil.

Compound 11: Compound 10 (1.36 g, 4.70 mmol) and triphenylphosphine (1.48 g, 5.64 mmol) were dissolved in 24 mL of THF and 8 mL of H<sub>2</sub>O, and the resulting solution was stirred at room temperature for 2 hours. Approximately 160  $\mu$ L (eight drops) of 1 N NaOH was added, and the mixture was stirred for 18 hours. The mixture was concentrated under vacuum, and the concentrate was purified by silica gel chromatography (80/8/2 CH<sub>3</sub>CN/H<sub>2</sub>O/con NH<sub>4</sub>OH) to give 1.16 g (94%) of 11 as a yellow oil: <sup>1</sup>H NMR (CDCl<sub>3</sub>)  $\delta$  1.50 (s, 9H), 1.90 (brd, 2H), 2.88 (t, 2H), 3.56 (t, 2H), 3.65 (m, 4H), 3.71 (m, 2H), 4.01 (m, 2H).

1,2-Bis(2-iodoethoxy)ethane, compound 12: A solution of 10.0 g (5.3 mmol) of 1,2-bis(2-chloroethoxy)ethane (Aldrich Chemical Co.) and 16.0 g (107 mmol) of sodium iodide in 110 mL of acetone was heated at reflux for 18 h. The mixture was concentrated and the residue was triturated with CHCl<sub>3</sub> to dissolve product while salts remained undissolved. The mixture was filtered, and the filtrate was concentrated to give an orange oil. Purification by silica gel chromatography (step gradient, 10/90 EtOAc/hexanes to 15/85 EtOAc/hexanes) to provide 17.8 g (90%) of an orange oil: <sup>1</sup>H NMR (CDCl<sub>3</sub>)  $\delta$  3.28 (t, 4H), 3.67 (s, 4H), 3.78 (t, 4H); <sup>13</sup>C NMR (CDCl<sub>3</sub>)  $\delta$  3.6, 70.5, 72.2.

Compound 13: DBU (284  $\mu$ L, 290 mg, 1.90 mmol) was added to a mixture of 266 mg (2.0 mmol) of N-(tert-butyloxycarbonyl)hydroxylamine (Aldrich Chemical Co.) and 2.96 g (8.0 mmol) of compound 12, and the mixture was capped and shaken until homogeneous. After 15 minutes the mixture solidified, and it was allowed to stand for 45 minutes. To the mixture was added 5 mL of CH<sub>2</sub>Cl<sub>2</sub>, and the mixture was shaken again to dissolve solids. The resulting solution was added to 200 mL of EtOAc. An additional 50 mL of EtOAc was added, and the mixture was filtered to remove solids. The filtrate was concentrated to give an oil which was partitioned between 100 mL of EtOAc and 3 x 50 mL of 1 N HCl solution. The EtOAc layer was washed with 2 x 50 mL of 1 N NaOH followed by 2 x 50 mL of 5% sodium bisulfite solution and concentrated to provide 2.6 g of yellow oil. Purification by silica gel chromatography (step gradient, 20/80 to 45/55 EtOAc/hexanes) gave 515

mg (69%) of compound 13 as a yellow oil:  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  1.50 (s, 9H), 3.28 (t, 2H), 3.68 (s, 4H), 3.72 (m, 4H), 4.02 (t, 2H), 7.72 (s, 1H);  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ )  $\delta$  2.9, 28.3, 68.9, 69.4, 70.2, 70.6, 72.0, 75.4, 81.6, 156.9.

Diethyleneglycol bis-4-nitrophenylcarbonate, Compound 60: Pyridine (30.5 mL, 377 mmol) was slowly added to a  $0^\circ\text{C}$  solution of 5.0 g (47.11 mmol) of diethylene glycol and 23.74 g (118 mmol) of 4-nitrophenylchloroformate in 500 mL of THF. The cooling bath was removed, and the mixture was stirred for 18 hours at room temperature. The mixture was cooled back to  $0^\circ\text{C}$ , acidified with 6 N HCl, and partitioned between 400 mL of 1 N HCl and 2 X 400 mL of  $\text{CH}_2\text{Cl}_2$ . The combined organic layers were dried ( $\text{MgSO}_4$ ), filtered, and concentrated to give 24.3 g of a white solid. Crystallization from hexanes/EtOAc gave 16.0 g (78%) of compound 60 as a white powder: mp  $110^\circ\text{C}$ ;  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  3.89 (t, 4H), 4.50 (t, 4H), 7.40 (d, 4H), 8.26 (d, 4H).

Compound 61: A solution of 2.5 g (5.73 mmol) of compound 60 in 17 mL of pyridine was added to a  $0^\circ\text{C}$  solution of 1.8 g (17.2 mmol) of diethanolamine in 3 mL of pyridine. The cooling bath was removed, and the mixture was stirred for 5 hours at room temperature to yield compound 61, which was not isolated but was used as is in the next step.

Compound 14: The mixture from the previous step was cooled back to  $0^\circ\text{C}$ , 40 mL of  $\text{CH}_2\text{Cl}_2$  was added followed by a solution of 11.55 g (57.3 mmol) of 4-nitrophenylchloroformate in 60 mL of  $\text{CH}_2\text{Cl}_2$ , and the mixture was stirred for 20 hours at room temperature. The mixture was cooled back to  $0^\circ\text{C}$ , acidified with 1 N HCl, and partitioned between 300 mL of 1 N HCl and 2 X 200 mL of  $\text{CH}_2\text{Cl}_2$ . The combined organic layers were dried ( $\text{MgSO}_4$ ), filtered, and concentrated to give 13.6 g of yellow solid. Purification by silica gel chromatography ( $\text{CH}_2\text{Cl}_2/\text{MeOH}$  and EtOAc/hexanes) provided 4.91 g (83%) of compound 14 as a sticky amorphous solid:  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  3.72 (m, 12H), 4.31 (t, 4H), 4.48 (m, 8H), 7.40 (m, 8H), 8.29 (m, 8H).

BOC-Protected AOTEG/DEA/DEG Platform, Compound 15:

5 Triethylamine (157  $\mu\text{L}$ , 114 mg, 1.13 mmol) was added to a stirred solution of 193 mg (0.188 mmol) of compound 14 (prepared as described above and in U.S. Serial No. 60/111,641, filed December 9, 1998) followed by 298 mg (1.13 mmol) of compound 11. The mixture was allowed to come to room temperature and was stirred overnight. The mixture was cooled to  $0^\circ\text{C}$ , acidified with 1 N HCl, and

nitrophenylchloroformate in 14 mL of CH<sub>2</sub>Cl<sub>2</sub>, and the mixture was stirred at room temperature for 18 hours. The mixture was cooled to 0°C and acidified with 1N aqueous HCl. The resulting mixture was partitioned between 100 mL of 1 N aqueous HCl and 3 x 100 mL of CH<sub>2</sub>Cl<sub>2</sub>. The combined organic layers were dried (MgSO<sub>4</sub>), filtered, and concentrated to give 1.05 g of a sticky solid. Purification by silica gel chromatography (6/4 hexanes/EtOAc) gave 505 mg (62%) of compound 17 as a slightly yellow oil: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.47 (s, 9H), 3.67-3.78 (m, 6H), 3.80 (m, 2H), 4.02 (m, 2H), 4.48 (m, 2H), 7.40 (d, 2H), 7.50 (s, 1H), 8.29 (d, 2H); mass spectrum (ES) m/z calculated for C<sub>18</sub>H<sub>26</sub>N<sub>2</sub>O<sub>10</sub>Na (M+Na): 453.1. Found: 453.0.

Boc-protected AOTEG/PIZ/DEA/DEG platform, compound 19: To a solution of compound 18 (prepared as described in U.S. Serial No. 60/111,641, filed December 9, 1998) in a mixture of aqueous sodium bicarbonate and dioxane is added a solution of four equivalents of compound 17 in dioxane. Upon completion of the reaction, the mixture is partitioned between water and CH<sub>2</sub>Cl<sub>2</sub>. The CH<sub>2</sub>Cl<sub>2</sub> layer is concentrated, dried, and purified by silica gel chromatography to provide compound 19.

AOTEG/PIZ/DEA/DEG platform, compound 20: The Boc-protecting groups are removed from compound 19 in a manner essentially similar to that described for the preparation of compound 16 to provide compound 20.

#### Example 5a - Synthesis of AOTEG/SA/AHAB/TEG Platform

The synthetic scheme is shown in Figure 5.

S-acetyl-2-[2-(2-N-tert-butyloxycarbonylaminoxyethoxy)ethoxy]-ethylmercaptan, Compound 21a: To a solution of 500 mg (1.52 mmol) of compound 9a in 30 mL of acetone was added 191 mg (1.68 mmol) of potassium thioacetate (Aldrich Chemical Co.). The mixture was stirred at room temperature for 18 hours, and the resulting precipitate was removed by filtration. The filtrate was concentrated and partitioned between 300 mL of EtOAc and 2 x 80 mL of brine. The EtOAc layer was dried (NaSO<sub>4</sub>), filtered, and concentrated to give 460 mg (93%) of compound 21a as a light brown oil: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.48 (s, 9H), 2.35 (s, 3H), 3.12 (t, 2H),

3.61 (t, 2H), 3.64 (m, 4H), 3.73 (m, 2H), 4.02 (m, 2H), 5.52 (s, 1H); <sup>13</sup>C NMR (CDCl<sub>3</sub>) δ 28.3, 28.8, 30.6, 69.3, 69.8, 70.2, 70.5, 75.3, 81.5, 156.8, 195.3.

2-[2-(2-N-tert-butyloxycarbonylaminoxyethoxy)ethoxy]ethylmercaptan,

Compound 22a: Compound 21a is treated with a nitrogen sparged solution of 4/1 6N NH<sub>4</sub>OH/CH<sub>3</sub>CN in a nitrogen atmosphere for 1 hour at room temperature. The mixture is concentrated under vacuum to provide compound 22a which can be used without further purification.

Boc-Protected AOTEG/SA/AHAB/TEG platform, 24a: Compound 23

(prepared as described; Jones et al. J. Med. Chem. 1995, 38, 2138-2144.) is added to a solution of four equivalents of compound 22a in nitrogen sparged 10/90 H<sub>2</sub>O/CH<sub>3</sub>CN. To the resulting solution is added four equivalents of diisopropylethylamine. Upon completion of the reaction, the mixture is partitioned between water and CH<sub>2</sub>Cl<sub>2</sub>. The CH<sub>2</sub>Cl<sub>2</sub> layer is concentrated, dried, and purified by silica gel chromatography to provide compound 24a.

AOTEG/SA/AHAB/TEG platform, 25a: The Boc-protecting groups are

removed from compound 24a in a manner essentially similar to that described for the preparation of compound 16 to provide compound 25a.

Example 5b - Synthesis of AOHEX/SA/AHAB/TEG Platform

The synthetic scheme is shown in Figure 6.

1-Iodo-6- (N-tert-butyloxycarbonyl)aminoxyhexane, compound 9b: To a

heterogeneous mixture of 140 mg (1.05 mmol) of N-(tert-butyloxycarbonyl)hydroxylamine (Aldrich Chemical Co.) and 658 μL (1.35 mg, 4.0 mmol) of compound 12 was added 149 μL (152 mg, 1.0 mmol) of DBU. The mixture was stirred at room temperature for 30 seconds at which time the reaction mixture solidified. The solid mass was allowed to stand overnight and was dissolved in 50 mL of CH<sub>2</sub>Cl<sub>2</sub>. The solution was washed with 2 x 25 mL of 1 N NaOH and 3 x 25 mL of 1 N HCl. The combined basic aqueous layers were extracted with 25 mL of CH<sub>2</sub>Cl<sub>2</sub>, and the combined acidic aqueous layers were extracted with 25 mL of CH<sub>2</sub>Cl<sub>2</sub>. The combined CH<sub>2</sub>Cl<sub>2</sub> layers were dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated to give a yellow oil. Purification by silica gel chromatography (step

gradient; 1/99/0.1 to 15/85/0.1 EtOAc/hexanes/MeOH) provided 216 mg (68%) of 9b as a yellow oil:  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  1.40 (m, 4H), 1.48 (s, 9H), 1.62 (m, 2H), 1.83 (m, 2H), 3.20 (t, 2H), 3.84 (t, 2H), 7.10 (s, 1H).

S-acetyl-6-(N-tert-butyloxycarbonyl)aminoxyhexan-1-thiol, Compound 21b:

Compound 9b (209 mg, 0.61 mmol) was added to a solution of potassium thioacetate in 15 mL of acetone, and the mixture was stirred at room temperature for 18 hours. The acetone was removed under vacuum, and the residue was partitioned between 50 mL of  $\text{CH}_2\text{Cl}_2$  and 3 x 25 mL of 1 N NaOH. The  $\text{CH}_2\text{Cl}_2$  layer was dried ( $\text{Na}_2\text{SO}_4$ ), filtered, and concentrated to give a brown oil. Purification by silica gel chromatography (15/85 EtOAc/hexanes) provided 166 mg (94%) of compound 21b as a colorless oil:  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  1.39 (m, 4H), 1.48 (s, 9H), 1.59 (m, 4H), 2.32 (s, 3H), 2.86 (t, 2H), 3.82 (t, 2H), 7.10 (s, 1H).

6-(N-tert-butyloxycarbonyl)aminoxyhexan-1-thiol, Compound 22b:

A purified sample of 22b was prepared as follows. Compound 21b (50 mg, 172  $\mu\text{mol}$ ) and 22  $\mu\text{L}$  (17.4 mg, 85.8  $\mu\text{mol}$ ) of tri-n-butylphosphine was placed under nitrogen, and 2 mL of a nitrogen sparged 1 M solution of NaOH in MeOH was added to the mixture. The mixture was stirred for 18 hours at room temperature, and 172  $\mu\text{L}$  (180 mg, 3 mmol) of trifluoroacetic acid was added. The mixture was partitioned between 25 mL of EtOAc and 3 x 25 mL of 1 N HCl. The combined aqueous layers were extracted with 25 mL of EtOAc, dried ( $\text{Na}_2\text{SO}_4$ ), filtered, and concentrated to give an oil. Purification by silica gel chromatography (15/85/0.1 EtOAc/hexanes/MeOH) provided 28 mg of 22b as a colorless oil:  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  1.32 (t, 1H), 1.40 (m, 4H), 1.49 (s, 9H), 1.62 (m, 4H), 2.53 (d of t, 2H), 3.84 (t, 2H), 7.09 (s, 1H).

Boc-Protected AOHEX/SA/AHAB/TEG platform, 24b:

Compound 21b (13 mg, 45  $\mu\text{mol}$ ) and 6  $\mu\text{L}$  (4.5 mg, 22.3  $\mu\text{mol}$ ) of tri-n-butylphosphine was placed under nitrogen, and 3 mL of a nitrogen sparged solution of 4/1 6 N  $\text{NH}_4\text{OH}/\text{CH}_3\text{CN}$  was added to the mixture. The mixture was stirred for 1 hour at room temperature and concentrated under vacuum. The residue was dissolved in 3 mL of a nitrogen sparged solution of 10/90 water/ $\text{CH}_3\text{CN}$ . To the resulting solution, which was kept under nitrogen atmosphere, was added 10 mg (7.44  $\mu\text{mol}$ ) of compound 23 followed by 8  $\mu\text{L}$  (5.77 mg, 44.6  $\mu\text{mol}$ ) of diisopropylethylamine. The mixture was stirred for

18 hours and concentrated under vacuum. The residue was purified by silica gel chromatography (multiple step gradient, 1/99 to 5/95 to 7.5/92.5 to 10/90 to 15/85 MeOH/CH<sub>2</sub>Cl<sub>2</sub>) to provide 14 mg (93%) of 24b as a colorless oil: TLC (10/90 MeOH/CH<sub>2</sub>Cl<sub>2</sub>), R<sub>f</sub> = 0.3; mass spectrum (ES) m/z calculated for C<sub>92</sub>H<sub>174</sub>N<sub>14</sub>O<sub>26</sub>S<sub>4</sub> (M+2H)/2: 1010. Found: 1010.

AOHEX/SA/AHAB/TEG platform, 25b: The Boc-protecting groups are removed from compound 24b in a manner essentially similar to that described for the preparation of compound 16.

#### Example 6 - Synthesis of AOHOC/DT/TEG Platform

The synthetic scheme is shown in Figure 7.

6-(tert-butyloxycarbonylaminoxy)hexan-1-ol, 27: To a solution of 179  $\mu$ L (183 mg, 1.2 mmol) of DBU in 1 mL of CH<sub>2</sub>Cl<sub>2</sub> was added 133 mg (1.0 mmol) of N-(tert-butyloxycarbonyl)hydroxylamine (Aldrich Chemical Co.) and 157  $\mu$ L (217 mg, 1.2 mmol) of 6-bromohexan-1-ol (Aldrich Chemical Co.), and the mixture was stirred for 18 hours at room temperature. The mixture was concentrated to give a yellow oil. Purification by silica gel chromatography (35/5/65 EtOAc/MeOH/hexanes) gave 180 mg (77%) of compound 27 as a colorless oil: <sup>1</sup>H NMR (CDCl<sub>3</sub>)  $\delta$  1.39 (m, 4H), 1.48 (s, 9H), 1.59 (m, 4H), 3.63 (t, 2H), 3.85 (t, 2H), 7.42 (s, 1H); <sup>13</sup>C NMR (CDCl<sub>3</sub>)  $\delta$  25.6, 25.8, 28.1, 28.4, 62.8, 76.8, 81.7, 157.2.

Compound 28: To a solution of 100 mg (0.428 mmol) of compound 27 in 2 mL of CH<sub>2</sub>Cl<sub>2</sub> at 0°C was added 90  $\mu$ L (88.1 mg, 1.11 mmol) of pyridine followed by 113 mg (0.557 mmol) of p-nitrophenylchloroformate (Aldrich Chemical Co.). The mixture was stirred at room temperature for 4 hours, cooled to 0°C, acidified with 1 N HCl, and partitioned between 20 mL of 1 N HCl and 3 x 20 mL of CH<sub>2</sub>Cl<sub>2</sub>. The combined CH<sub>2</sub>Cl<sub>2</sub> layers were washed with a saturated solution of NaHCO<sub>3</sub>, dried (MgSO<sub>4</sub>), filtered, and concentrated. Purification by silica gel chromatography to provided compound 28.

Compound 29: To a solution of diethylenetriamine in EtOAc is added two equivalents of diisopropylethylamine followed by two equivalents of compound 28.

The mixture is stirred until the reaction is complete. The solvents are removed and the product, compound 29, is purified by silica gel chromatography.

Boc-protected AOHOC/DT/TEG Platform, 30: To a solution of triethylene glycol bis-chloroformate (Aldrich Chemical Co.) in pyridine is added two equivalents of compound 29. The mixture is stirred until the reaction is complete and partitioned between 1 N HCl and CH<sub>2</sub>Cl<sub>2</sub>. The CH<sub>2</sub>Cl<sub>2</sub> layer is dried and concentrated, and the product is purified by silica gel chromatography to give compound 30.

AOHOC/DT/TEG Platform, 31: The Boc-protecting groups are removed from compound 30 in a manner essentially similar to that described for the preparation of compound 16.

#### Example 7 - Synthesis of AOTEG/IDA/TEG Platform

The synthetic scheme is shown in Figure 8.

Compound 32: To a solution of triethylene glycol bis-chloroformate (Aldrich Chemical Co.) in pyridine is added two equivalents of iminodiacetic acid (Aldrich Chemical Co.). The mixture is stirred until the reaction is complete and partitioned between 1 N HCl and CH<sub>2</sub>Cl<sub>2</sub>. The CH<sub>2</sub>Cl<sub>2</sub> layer is dried and concentrated, and the product is purified by silica gel chromatography to give compound 32.

Compound 33: A solution of compound 32 in THF is treated with 6 equivalents of NHS and 6 equivalents of DCC for 1 hour. To the mixture is added 4 equivalents of compound 11, and the mixture is stirred until the reaction is complete. Acetic acid is added to quench excess DCC, and the resulting solids are removed by filtration. The filtrate is concentrated and purified by silica gel chromatography to provide compound 33.

Compound 34: The Boc-protecting groups are removed from compound 33 in a manner essentially similar to that described for the preparation of compound 16.

#### Example 8 - Synthesis of AOTEGO/LEV/PITG Platform

The synthetic scheme is shown in Figure 9.

p-Nitrophenyl-levulinate, 35: To a solution of 800 mg (6.89 mmol) of levulinic acid (Aldrich Chemical Co.) in 4.25 mL of pyridine was added 1.78 g (7.58

mmol) of 4-nitrophenyltrifluoroacetate (Aldrich Chemical Co.). The resulting solution was stirred for 15 minutes and partitioned between 28 mL of water and 2 x 28 mL of CH<sub>2</sub>Cl<sub>2</sub>. The combined CH<sub>2</sub>Cl<sub>2</sub> layers were dried (MgSO<sub>4</sub>), filtered, and concentrated. Purification of the concentrate by silica gel chromatography (step gradient, 25/75 to 30/70 EtOAc/hexanes) provided 1.06 g (74%) of compound 35: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 2.28 (s, 3H), 2.87 (m, 4H), 7.29 (d, 2H), 8.28 (d, 2H).

1,2-Bis(2-(tert-butyloxycarbonyl)aminoxyethoxy)ethane, compound 36:

To 243 mg (0.66 mmol) of compound 12 was added 219 mg (1.64 mmol) of N-(tert-butyloxycarbonyl)hydroxylamine (Aldrich Chemical Co.) followed by 246 μL (250 mg, 1.64 mmol) of DBU. The mixture was stirred at room temperature until it solidified (approximately 1 hour). After standing for an additional hour, the mixture was dissolved in 2 mL of CH<sub>2</sub>Cl<sub>2</sub>, and the resulting solution was added to 100 mL of EtOAc to precipitate the hydrogen-iodide salt of DBU. An additional 50 mL of EtOAc was added, and the mixture was filtered. The filtrate was washed with 2 x 50 mL of 1 N HCl, 2 x 50 mL of 5% sodium bisulfite solution, and 25 mL of brine. The EtOAc layer was dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated to give an oil. Purification by silica gel chromatography (step gradient, 40/60 to 50/50 to 80/20 EtOAc/hexanes) to give 164 mg (65%) of compound 36 as a colorless oil: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.48 (s, 18H), 3.65 (s, 4H), 3.72 (t, 4H), 4.02 (t, 4H), 7.80 (s, 2H); <sup>13</sup>C NMR (CDCl<sub>3</sub>) δ 28.2, 69.0, 70.3, 75.2, 81.3, 156.8.

1,2-Bis(2-aminoxyethoxy)ethane, compound 37: Compound 36 (559 mg, 1.47 mmol) was dissolved in 15 mL of EtOAc, and HCl gas was bubbled through the solution for 30 minutes. The mixture was concentrated under vacuum to provide 72 mg (90%) of compound 37 as the HCl salt as a sticky residue: <sup>1</sup>H NMR (D<sub>2</sub>O) δ 3.75 (s, 4H), 3.87 (m, 4H), 4.27 (m, 4H); mass spectrum (ES) m/z calculated for C<sub>6</sub>H<sub>17</sub>N<sub>2</sub>O<sub>4</sub> (M+H): 181.1. Found: 181.1.

Compound 38: Compound 3 is treated with a 30% solution of HBr in acetic acid to remove the CBZ protecting groups and provide a tetra-amine hydrogen bromide salt. The tetra-amine is dissolved in a solution of sodium bicarbonate in water and dioxane, and to the resulting solution is added four equivalents of compound 35. Upon completion of the reaction, the mixture is partitioned between

water and  $\text{CH}_2\text{Cl}_2$ . The  $\text{CH}_2\text{Cl}_2$  layer is concentrated, dried, and purified by silica gel chromatography to provide compound 38.

AOTEGO/LEV/PITG Platform, compound 39: To a solution of compound 38 in 0.1 M pH 4.6 sodium acetate buffer is added twenty equivalents of compound 37.

5 Upon completion of the reaction, the mixture is partitioned between water and  $\text{CH}_2\text{Cl}_2$ . The  $\text{CH}_2\text{Cl}_2$  layer is concentrated, dried, and purified by silica gel chromatography to provide compound 39.

#### Example 9 - Synthesis of AO/DEGA/DEG Platform

10 The synthetic scheme is shown in Figure 10.

Compound 41: Bromine (approximately six equivalents) is added dropwise to a solution of compound 40, six equivalents of triphenylphosphine, and 8 equivalents of pyridine in  $\text{CH}_2\text{Cl}_2$  until an orange color persists. The mixture is stirred at room temperature for 0.5 h or until reaction is complete, and a saturated solution of sodium bisulfite is added to destroy excess bromine. The mixture is then partitioned between  $\text{H}_2\text{O}$  and EtOAc. The combined organic layers are washed with brine, dried ( $\text{Na}_2\text{SO}_4$ ), filtered, concentrated, and purified by silica gel chromatography to provide compound 41.

Compound 42: To compound 41, is added six equivalents of N-(tert-butyloxycarbonyl)hydroxylamine (Aldrich Chemical Co.) and six equivalents of DBU. The mixture is heated as necessary for a sufficient time for the reaction to come to completion. When cool, the mixture is dissolved in  $\text{CH}_2\text{Cl}_2$  and the resulting solution is added to EtOAc resulting in the formation of a precipitate which is removed by filtration, and the filtrate is concentrated. Purification by flash chromatography provides 42.

Compound 43: The Boc-protecting groups are removed from compound 42 in a manner essentially similar to that described for the preparation of compound 16.

#### Example 10 - Synthesis of Tetravalent D1 Conjugate

30 The synthetic scheme is shown in Figure 11.

45

Synthesis of Tetravalent D1 Conjugate, Compound 44: TA/D1, prepared as described in Example 1 (0.90 mg,  $1.28 \times 10^{-7}$  mol) was dissolved in 250  $\mu$ L of 0.1 M sodium acetate pH 4.60 buffer in a polypropylene tube. To the mixture was added 16.6  $\mu$ L (18.9 ug,  $1.60 \times 10^{-8}$  mol) of a 0.97  $\mu$ mol/mL solution of AOA/PITG platform, compound 5, in 0.1 M sodium acetate pH 4.60 buffer. The mixture was agitated gently under nitrogen for 6 days at which time the reaction appeared to be complete by analytical HPLC using a 4.6 mm X 250 mm, 300 Å, 5  $\mu$ m, diphenyl column (Vydac) with detection at 280 nm (1 mL/min; gradient 25%-45% B, 0-20 min, A = 0.1%TFA/H<sub>2</sub>O, B = 0.1%TFA/CH<sub>3</sub>CN). Approximate retention times are as follows: TA/D1, 13.7 min; compound 44, 17.2 min). The mixture was diluted with 95/5 water/acetonitrile to a volume of 1 mL and purified by HPLC (10 mm X 250 mm, 300 Å, 5  $\mu$ m, diphenyl column (Vydac) (3 mL/min; gradient 25%-45% B, 0-40 min, A = 0.1%TFA/H<sub>2</sub>O, B = 0.1%TFA/CH<sub>3</sub>CN). Fractions containing pure 44, as evidenced by analytical HPLC, were pooled and lyophilized to provide 0.4 mg (25%) of 44: mass spectrum (ES, average m/z) calculated for C<sub>1320</sub>H<sub>2032</sub>N<sub>338</sub>O<sub>370</sub>S<sub>20</sub>: 29,198. Found: 29,218.

Example 11 - Synthesis of Tetravalent D1 Conjugate

The synthetic scheme is shown in Figure 12.

Synthesis of Tetravalent D1 Conjugate, Compound 45: TA/D1, prepared as described in Example 1, (5.20 mg,  $7.37 \times 10^{-7}$  mol) was dissolved in 2.0 mL of He sparged 0.1 M sodium acetate pH 4.60 buffer in a polypropylene tube. To the mixture was added 15.07  $\mu$ L (139 ug,  $1.23 \times 10^{-7}$  mol) of a 8.147  $\mu$ mol/mL solution of AOTEG/DEA/DEG platform, compound 16, in 0.1 M sodium acetate pH 4.60 buffer. The mixture was agitated gently under nitrogen for 23 hours at which time the reaction appeared to be complete by analytical HPLC using a 4.6 mm X 250 mm, 300 Å, 5  $\mu$ m, diphenyl column (Vydac) with detection at 280 nm (1 mL/min; gradient 25%-45% B, 0-20 min, A = 0.1%TFA/H<sub>2</sub>O, B = 0.1%TFA/CH<sub>3</sub>CN). Approximate retention times are as follows: TA/D1, 13.7 min; 45, 17.2 min). The mixture was diluted with water to a volume of 5 mL and purified by HPLC (10 mm X 250 mm, 300 Å, 5  $\mu$ m, diphenyl column (Vydac) (3 mL/min; gradient 25%-45% B, 0-40 min,

46

A = 0.1%TFA/H<sub>2</sub>O, B = 0.1%TFA/CH<sub>3</sub>CN). Fractions containing pure 45, as evidenced by analytical HPLC, were pooled and lyophilized to provide 1.73 mg (48%) of 45: mass spectrum (ES, average m/z) calculated for C<sub>1322</sub>H<sub>2048</sub>N<sub>334</sub>O<sub>377</sub>S<sub>20</sub>: 29,294. Found: 29,294.

5

Example 12 - Preparation of Model Aminooxy Compounds and Comparison of Reactivities with Glyoxyl-peptide

The synthetic scheme is shown in Figure 14.

10

Synthesis of glyoxyl-peptide, compound 47: Compound 46 (SEQ. ID No. 1) was prepared by standard solid phase synthesis on Wang resin, using N-Fmoc protected aminoacids. Couplings were done with 3 equivalents of N-Fmoc-protected aminoacid, 3 equivalents of DIC, and 3 equivalents of HOBt in DMF. Deprotections were done with 20% pyridine in DMF. The peptide was cleaved from the resin and purified by reversed phase HPLC (C<sub>18</sub>, gradient, 10-30% B, 0-40 min, A = 0.1% TFA/H<sub>2</sub>O, B = 0.1%TFA/CH<sub>3</sub>CN). The pure fractions, as evidenced by analytical HPLC (4.6 x 250 mm C<sub>18</sub>, 1 mL/min, gradient, 10-60% B, 0-20 min, A = 0.1%TFA/H<sub>2</sub>O, B = 0.1%TFA/CH<sub>3</sub>CN, T<sub>r</sub> = 10.3 min) were lyophilized to provide compound 46 as a fluffy white solid: mass spectrum (ES) calculated for (M+H) C<sub>41</sub>H<sub>67</sub>N<sub>12</sub>O<sub>11</sub>: 903.5. Found: 903.5.

20

To a solution of 163 mg (0.18 mmol) of compound 46 in 3.67 mL of CH<sub>3</sub>CN and 19 mL of 10 mM sodium phosphate pH 7.0 buffer was added a solution of 77.2 mg (0.361 mmol) of sodium periodate in 5.4 mL of water. The mixture was stirred at room temperature for 30 minutes, and 100 µL of acetic acid was added. The mixture was filtered, and the filtrate was purified by HPLC (C<sub>18</sub>, gradient, 15-30% B, 0-40 min, A = 0.1%TFA/H<sub>2</sub>O, B = 0.1%TFA/CH<sub>3</sub>CN). The pure fractions, as evidenced by analytical HPLC (4.6 x 250 mm C<sub>18</sub>, 1 mL/min, gradient, 10-35% B, 0-20 min, A = 0.1%TFA/H<sub>2</sub>O, B = 0.1%TFA/CH<sub>3</sub>CN, T<sub>r</sub> = 17.6 min), were lyophilized to provide to give 124 mg (79%) of compound 47 (SEQ ID No. 2) as a white solid after lyophilization: mass spectrum (ES) calculated for (M+H) C<sub>40</sub>H<sub>62</sub>N<sub>11</sub>O<sub>11</sub>: 872.5. Found: 872.5.

30

47

09590592.060000  
003090" 26506560

Synthesis of compound 49: To a solution of 250 mg (0.801 mmol) of compound 2 in 5 mL of CH<sub>2</sub>Cl<sub>2</sub> was added 158  $\mu$ L (166 mg, 1.58 mmol) of aminodiethyleneglycol (Aldrich Chemical Co.). To the resulting solution was added 298  $\mu$ L (221 mg, 1.71 mmol) of diisopropylethylamine, and the mixture was stirred under nitrogen atmosphere at room temperature for 1.5 hours. The mixture was partitioned between 100 mL of CH<sub>2</sub>Cl<sub>2</sub> and 20 mL of saturated Na<sub>2</sub>CO<sub>3</sub> solution, the CH<sub>2</sub>Cl<sub>2</sub> layer was washed successively with two 20 mL portions of saturated Na<sub>2</sub>CO<sub>3</sub> solution, two 20 mL portions of 1 N HCl, and 20 mL of brine. The aqueous HCl layer was extracted with five 50 mL portions of CH<sub>2</sub>Cl<sub>2</sub>; the aqueous Na<sub>2</sub>CO<sub>3</sub> layer was extracted with two 50 mL portions of CH<sub>2</sub>Cl<sub>2</sub>. The combined organic layers were dried (MgSO<sub>4</sub>), filtered, and concentrated to give a yellow oil. Purification by silica gel chromatography (70/30 EtOAc/hexanes) gave 164 mg (73%) of the Boc-protected precursor to compound 49 as a sticky colorless oil: <sup>1</sup>H NMR (CDCl<sub>3</sub>)  $\delta$  1.48 (s, 9H), 3.52 (m, 2H), 3.62 (m, 4H), 3.77 (m, 2H), 4.35 (s, 2H), 7.64 (s, 1H), 8.33 (brd s, 1H).

The Boc protecting group was removed as follows. The Boc protected precursor (164 mg, 0.59 mmol) was dissolved in 5 mL of 50/50 trifluoroacetic acid/CH<sub>2</sub>Cl<sub>2</sub> and the mixture was stirred for two hours at room temperature. The mixture was evaporated under a gentle stream of nitrogen, and the residue was redissolved in CH<sub>2</sub>Cl<sub>2</sub>. The solution was concentrated under vacuum to give 179 mg (104 % of theory, remainder assumed to be TFA) of the trifluoroacetate salt of compound 49 as a colorless oil: mass spectrum (ES) calculated for (M+H) C<sub>6</sub>H<sub>15</sub>N<sub>2</sub>O<sub>4</sub>: 179.2. Found: 179.1.

Synthesis of compound 50: To a solution of 5.0 mg (5.62  $\mu$ mol) of compound 47 in 7.6 mL of 0.1 M pH 4.6 sodium acetate buffer was added 582  $\mu$ L of a solution of 3.29 mg of compound 49 (estimated purity 96%, 1.70 mg, 5.82  $\mu$ mol) in 10 mL of 0.1 M pH 4.6 sodium acetate buffer, and the mixture was stirred for six days. The mixture was purified directly by HPLC (C<sub>18</sub>; gradient, 25%-45% B, 0-40 min, A = aqueous pH 7.0 triethylammonium phosphate (prepared by mixing 500 mL of 0.1% H<sub>3</sub>PO<sub>4</sub> with approximately 500 mL of 0.3% Et<sub>3</sub>N to provide a pH of 7.0), B = CH<sub>3</sub>CN). Fractions containing product were lyophilized to provide 0.3 mg of

48

compound 50: mass spectrum (ES) calculated for (M+H)  $C_{46}H_{74}N_{13}O_{14}$ : 1032.5.

Found: 1032.6.

Synthesis of compound 51: Compound 8 (100 mg, 0.38 mmol) was dissolved in 25 mL of 1/9 trifluoroacetic acid/ $CH_2Cl_2$  and the mixture was allowed to stand for 2 hours at room temperature. The mixture was evaporated under a gentle stream of nitrogen, and the residue was redissolved in  $CH_2Cl_2$ . The solution was concentrated under vacuum to give 152 mg (145% of theory, remainder assumed to be TFA) of the trifluoroacetate salt of compound 51 as a colorless oil: mass spectrum (ES) calculated for (M+H)  $C_6H_{16}NO_4$ : 165.1. Found: 165.1.

Synthesis of compound 52: To a solution of 5.0 mg (5.62  $\mu$ mol) of compound 47 in 7.6 mL of 0.1 M pH 4.6 sodium acetate buffer was added 845  $\mu$ L of a solution of 3.29 mg of compound 51 (estimated purity 69%, 1.63 mg, 5.82  $\mu$ mol) in 10 mL of 0.1 M pH 4.6 sodium acetate buffer, and the mixture was stirred for 21 hours. The mixture was purified directly by HPLC ( $C_{18}$ ; gradient, 25%-45% B, 0-40 min, A = aqueous pH 7.0 triethylammonium phosphate (prepared by mixing 500 mL of 0.1%  $H_3PO_4$  with approximately 500 mL of 0.3%  $Et_3N$  to provide a pH of 7.0), B =  $CH_3CN$ ). Fractions containing product were lyophilized to provide 3 mg of compound 52: mass spectrum (ES) calculated for (M+H)  $C_{46}H_{75}N_{12}O_{14}$ : 1019.5. Found: 1019.5.

Comparison of rates of conversion of 49 to 50 and 51 to 52: The rates of conversion of 49 (AOA-ADEG-OH, comprising an aminooxyacetyl group) to product 50, and 51 (AO-TEG-OH, comprising an aminooxyalkyl group) to 52, were measured by injecting aliquots of reaction mixture onto an analytical HPLC at various time points, and measuring the amount of product at that time by analytical HPLC ( $C_{18}$ , gradient, 10-60% B, 0-40 min, A = 0.1%TFA/ $H_2O$ , B = 0.1%TFA/ $CH_3CN$ ). As illustrated in Figure 13, the valency platform molecule comprising aminooxyalkyl groups formed the oxime conjugate with the model peptide more quickly.

Example 13 - Alternative Method of Preparing a Tetravalent Conjugate Using Compound 37 as a Bifunctional Linker

49

As an alternative to reacting a transaminated domain 1  $\beta_2$ GPI polypeptide, or any other glyoxylated polypeptide, directly with a tetravalent aminooxy platform, a transaminated polypeptide can be reacted with an excess of compound 37 in pH 4.6 100 mM sodium acetate buffer to provide compound 53 in which an aminooxy linker is attached to the polypeptide (here, a domain 1 polypeptide) via an oxime bond. The synthetic scheme is shown in Figure 15. Compound 53 is separated from excess linker, and four equivalents of compound 53 is reacted with platform 38 in pH 4.6 100 mM sodium acetate buffer to form a second set of oxime bonds providing a tetravalent conjugate, compound 54.

Example 14 - Alternative Method of Preparing a Tetravalent Conjugate Using Compound 21a as a Precursor to a Bifunctional Linker

Treatment of compound 21a with ammonium hydroxide to remove the acetyl sulfur protecting group, then with trifluoroacetic acid to remove the Boc protective group provides linker 55. A glyoxyl-containing polypeptide, in this case TA/D1, is reacted with compound 55 to provide compound 56, Domain 1 with a the sulfhydryl linker attached via an oxime bond. Four equivalents of compound 56 can react with platform 23 to provide a tetravalent domain 1 polypeptide conjugate, compound 57. The synthetic scheme is shown in Figure 16.

Example 15 - Synthesis of compound 85, Figure 21

The synthesis of the aminooxy platform, compound 85, was accomplished in a manner essentially the same as the synthesis of compound 20 (shown in Figure 4); however, compound 28 was used instead of compound 17. Compound 18 was reacted with compound 28, as shown in Figure 23, to give the Boc-protected platform 99.

The Boc-protecting groups are removed from compound 99 in a manner essentially similar to that described for the preparation of compound 16 to provide 85.

Example 16 - Synthesis of compound 86, Figure 21

The preparation of compound 86 involved preparing Boc-protected aminooxyhexanoic acid, compound 105, and using it to acylate a tetra-amino platform, compound 108 as shown in Scheme B in Figure 24.

Ethyl 6-(N-tert-butyloxycarbonyl)aminooxyhexanoate, compound 104:

To a magnetically-stirred mixture of 500 mg (3.76 mmol) of N-(tert-butyloxycarbonyl)hydroxylamine (Aldrich Chemical Co.) and 267  $\mu$ L (335 mg, 1.50 mmol) of ethyl 6-bromohexanoate was added 1.12 mL (1.14 g, 7.51 mmol) of DBU over a period of approximately one minute. The mixture was allowed to stir for 24 hours, at which time it had partially solidified. The mixture was dissolved in 100 mL of  $\text{CH}_2\text{Cl}_2$ , and the resulting solution was shaken in a separatory funnel with four 25 mL portions of 1 N HCl and 25 mL of brine. The aqueous layers were discarded, and the  $\text{CH}_2\text{Cl}_2$  layer was dried ( $\text{MgSO}_4$ ), filtered, and concentrated. The resulting yellow oil was purified by silica gel chromatography (3/7 EtOAc/hexane) to provide 285 mg of compound 104:  $^1\text{H}$  NMR  $\text{CDCl}_3$  ( $\delta$ ) 1.25 (t, 3H), 1.42 (m, 2H), 1.50 (s, 9H), 1.65 (m, 4H), 2.30 (t, 2H), 3.83 (t, 2H), 4.12 (q, 2H), 7.28 (s, 1H);  $^{13}\text{C}$  NMR  $\text{CDCl}_3$  ( $\delta$ ) 14.4, 24.9, 25.6, 27.8, 28.4, 34.3, 60.4, 76.6, 81.7, 157.1, 173.8; HRMS (MALDI-FTMS) calculated for (M+Na)  $\text{C}_{13}\text{H}_{25}\text{NaNO}_5$ : 298.1630. Found: 298.1631.

6-(N-tert-butyloxycarbonyl)aminooxyhexanoic acid, compound 105:

To a solution of 1.50 g (5.44 mmol) of compound 104 in 20 mL of EtOH was added 5.44 mL (54.4 mmol) of 10 N NaOH, and the mixture was stirred for 18 hours. The mixture was partitioned between 100 mL of 1 N HCl and four 100 mL portions of  $\text{CH}_2\text{Cl}_2$ . The  $\text{CH}_2\text{Cl}_2$  layers were combined, dried ( $\text{MgSO}_4$ ), filtered, and concentrated to a yellow oil. Purification by silica gel chromatography (50/50/1 hexane/EtOAc/HOAc) gave 1.22 g (90%) of compound 105 as a colorless oil:  $^1\text{H}$  NMR  $\text{CDCl}_3$  ( $\delta$ ) 1.45 (m, 2H), 1.48 (s, 9H), 1.66 (m, 4H), 2.37 (t, 2H), 3.85 (t, 2H), 7.21 (s, 1H);  $^{13}\text{C}$  NMR  $\text{CDCl}_3$  ( $\delta$ ) 24.6, 25.5, 27.8, 28.4, 34.0, 76.6, 82.0, 157.5, 179.3.

N-hydroxysuccinimidyl 6-(N-tert-butyloxycarbonyl)aminooxyhexanoate, compound 106: To a solution of 1.07 g (4.32 mmol) of compound 105 and 497 mg (4.32 mmol) of N-hydroxysuccinimide in 20 mL of  $\text{CH}_2\text{Cl}_2$  was added 818 mg (1.01

mL, 6.48 mmol) of diisopropylcarbodiimide. The reaction was stirred for 18 hours at room temperature, and 1 mL of HOAc was added. The mixture was stirred for another 3 hours and concentrated under vacuum. The residue was dissolved in 75% EtOAc/hexanes, and insoluble material was removed by filtration. The filtrate was concentrated, and the resulting yellow oil was purified by silica gel chromatography (50/50 EtOAc/hexanes) to give 1.31 g (88%) of compound 106 as a colorless oil:  $^1\text{H}$  NMR  $\text{CDCl}_3$  ( $\delta$ ) 1.50 (s, 9H), 1.52 (m, 2H), 1.69 (m, 2H), 1.80 (m, 2H), 2.63 (t, 2H), 2.84 (s, 4H), 3.88 (t, 2H), 7.25 (s, 1H);  $^{13}\text{C}$  NMR  $\text{CDCl}_3$  ( $\delta$ ) 24.4, 25.1, 25.6, 27.5, 28.2, 30.8, 76.1, 81.5, 157.3, 168.6, 169.4.

Synthesis of Boc-Protected aminooxyhexanoyl/AHAB/TEG platform, 109:

Compound 107 was obtained and converted to compound 108 as previously described (US Pat. No. 5,633,395 reaction scheme 4). To a solution of 50 mg (0.058 mmol) of compound 108 in 1 mL of THF was added 38  $\mu\text{L}$  (37 mg, 0.464 mmol) of pyridine followed by a solution of 120 mg (0.348 mmol) of compound 106 in 1 mL of THF. The mixture was stirred for 18 hours, acidified with 1 N HCl, and partitioned between 15 mL of 1 N HCl and three 15 mL portions of  $\text{CH}_2\text{Cl}_2$ . The combined  $\text{CH}_2\text{Cl}_2$  layers were dried ( $\text{MgSO}_4$ ), filtered, and concentrated. The resulting oil was purified by silica gel chromatography (step gradient; 95/5  $\text{CH}_2\text{Cl}_2/\text{MeOH}$  to 90/10  $\text{CH}_2\text{Cl}_2/\text{MeOH}$  to 80/20  $\text{CH}_2\text{Cl}_2/\text{MeOH}$ ) to provide 25 mg (24%) of compound 109 as a gum:  $^1\text{H}$  NMR  $\text{CDCl}_3$  ( $\delta$ ) 1.32 (M, 18H), 1.47 (s, 9H), 1.65 (m, 18H), 2.20 (t, 16H), 1.80 (m, 2H), 3.21 (m, 8H), 3.40 (brd s, 16H), 3.68 (m, 8H), 3.82 (t, 8H), 6.52 (t, 2H), 6.60 (t, 2H), 7.13 (t, 2H), 7.21 (t, 2H), 7.88 (s, 1H); mass spectrum (ESI) ( $\text{M}+\text{H}$ ) calculated for  $\text{C}_{84}\text{H}_{157}\text{N}_{14}\text{O}_{26}$ : 1777. Found 1778.

Aminooxyhexanoyl/AHAB/TEG platform, 86: The Boc-protecting groups are removed from compound 109 in a manner essentially similar to that described for the preparation of compound 16 to provide 86.

Example 17 (Synthesis of compound 91, Figure 22)Synthesis of 1-azido-6-(N-tert-butyloxycarbonyl)aminooxyhexane, compound99:

A solution of 300 mg (0.874 mmol) of 1-iodo-6-(N-tert-butyloxycarbonyl)-aminooxyhexane (compound 98 prepared as described by Jones et al., Tetrahedron Letters 2000, 41, 1531-1533.) and 455 mg (7.00 mmol) of sodium azide in 4 mL of DMF was stirred for 72 hours under nitrogen. The mixture was partitioned between 50 mL of EtOAc and three 25 mL portions of H<sub>2</sub>O. The EtOAc layer was dried (MgSO<sub>4</sub>), filtered, and concentrated. Purification by silica gel chromatography (15/85 EtOAc/hexanes) provided 219 mg (97%) of compound 99 as a colorless oil: <sup>1</sup>H NMR CDCl<sub>3</sub> (δ) 1.41 (m, 4H), 1.49 (s, 9H), 1.63 (m, 4H), 3.28 (t, 2H), 3.83 (t, 2H), 7.22 (s, 1H); <sup>13</sup>C NMR CDCl<sub>3</sub> (δ) 25.7, 26.7, 28.0, 28.4, 28.9, 51.5, 76.7, 81.7, 157.1.

Synthesis of compound 96: In a reaction vessel equipped with a dry ice condenser, liquid ammonia is added to compound 22a (6.6 - 8.8 mmol), and the resulting mixture is stirred for 5 min. A per-6-deoxy-6-iodo-cyclodextrin (1 mmol, (Ashton et al., *J. Org. Chem.* 1996, 61, 903; Gadelle and Defaye, *Angew. Chem. Int. Ed. Engl.* 1991, 30, 78.) is added. After stirring for 6 h, the ammonia is allowed to evaporate, and the residue is further dried under vacuum and purified by flash column chromatography to provide compound 96.

Synthesis of 1-amino-6-(N-tert-butyloxycarbonyl)aminooxyhexane, compound 100:

A solution of 180 mg (0.697 mmol) of compound 99 and 219 mg (0.836 mmol) of triphenylphosphine in 4 mL of THF and 1 mL of H<sub>2</sub>O was stirred for 18 hours at room temperature. There was still starting material present as evidenced by TLC, so another 55 mg (0.209 mmol) of triphenylphosphine was added, and the mixture was stirred for 7 hours. The mixture was concentrated and purified by silica gel chromatography (step gradient; 2/5/93 to 2/10/88 con NH<sub>4</sub>OH/H<sub>2</sub>O/CH<sub>3</sub>CN) to provide 151 mg of compound 100 as a colorless oil: <sup>1</sup>H NMR CDCl<sub>3</sub> (δ) 1.35 (m, 4H), 1.49 (s, 9H), 1.61 (m, 4H), 2.69 (t, 2H), 3.82 (t, 2H); <sup>13</sup>C NMR CDCl<sub>3</sub> (δ) 25.8, 26.7, 28.1, 28.3, 33.2, 41.9, 76.7, 81.3, 157.1.

Synthesis of compound 101: To a solution of 84 mg (81.8  $\mu\text{mol}$ ) of compound 14 in 1 mL of  $\text{CH}_2\text{Cl}_2$  was added a solution of 114 mg (491  $\mu\text{mol}$ ) of compound 100 in 0.5 mL of  $\text{CH}_2\text{Cl}_2$  followed by 86  $\mu\text{L}$  (63 mg, 491  $\mu\text{mol}$ ) of diisopropylethylamine. The mixture was stirred for 18 hours at room temperature, quenched with 38  $\mu\text{L}$  (39 mg, 654  $\mu\text{mol}$ ) of acetic acid, and concentrated to an oil. Purification by silica gel chromatography (step gradient; 2/98 to 7.5/92.5 MeOH/ $\text{CH}_2\text{Cl}_2$ ) provided 115 mg (100%) of 101 as an oil:  $^1\text{H}$  NMR  $\text{CDCl}_3$  ( $\delta$ ) 1.38 (m, 16H), 1.47 (s, 36H), 1.59 (m, 16H), 3.13 (m, 8H), 3.50 (m, 8H), 3.69 (t, 4H), 3.82 (t, 8H), 4.18 (m, 4H), 4.22 (m, 8H), 5.42 (m, 2H), 5.56 (m, 2H); mass spectrum (ESI) (M+Na) calculated for  $\text{C}_{62}\text{H}_{116}\text{NaN}_{10}\text{O}_{25}$ : 1423. Found 1423.

Compound 91: The Boc-protecting groups are removed from compound 101 in a manner essentially similar to that described for the preparation of compound 16 to provide 91. The Reaction Scheme is shown in Figure 25.

Example 18 (Synthesis of compound 92, Figure 22)

Compound 92 was prepared as described in Figure 26. The tetra N-Boc-amino platform 39b' was prepared as described in PCT US99/29338. Essentially, diethyleneglycol was reacted with *para*-nitrophenylchloroformate to yield the di *para*-nitrophenylcarbonate compound, which was then reacted with diethanolamine to form the tetrahydroxy compound, which in turn was reacted with *para*-nitrophenylchloroformate to yield the tetra *para*-nitrophenylcarbonate compound, which in turn was reacted with tert-butyl N-(2-aminoethyl)carbamate to yield 39b'. Compound 39b' was deprotected with trifluoroacetic acid to provide the tetra-amine, compound 102.

Compound 103: To a solution of 20 mg (0.023 mmol) of compound 102 in 0.5 mL of saturated sodium bicarbonate solution was added a solution of 60 mg (0.140 mmol) of compound 17 in 0.5 mL of dioxane. The mixture was stirred for 5 hours at room temperature, cooled to  $0^\circ\text{C}$ , and acidified by dropwise addition of 1 N HCl. The mixture was partitioned between 7 mL of  $\text{H}_2\text{O}$  and four 10 mL portions of  $\text{CH}_2\text{Cl}_2$ . The combined  $\text{CH}_2\text{Cl}_2$  layers were washed with saturated sodium bicarbonate solution, dried ( $\text{MgSO}_4$ ), filtered, and concentrated. Purification by

preparative HPLC (C18, gradient, 30%B to 50% B over 40 min, A = 0.1% TFA/H<sub>2</sub>O, B = 0.1% TFA/CH<sub>3</sub>CN) gave 12 mg (27%) of 103 as a viscous oil: <sup>1</sup>H NMR CDCl<sub>3</sub> (δ) 1.48 (s, 36H), 3.26 (m, 16H), 3.51 (m, 8H), 3.68 (m, 44H), 4.02 (m, 8H), 4.21 (m, 12H), 6.12 (brd m, 8H), 8.09 (brd s, 4H); mass spectrum (ESI) (M+Na) calculated for C<sub>79</sub>H<sub>136</sub>NaN<sub>14</sub>O<sub>41</sub>: 1900. Found 1900.

Compound 92: The Boc-protecting groups are removed from compound 103 in a manner essentially similar to that described for the preparation of compound 16 to provide 92. The reaction scheme is shown in Figure 26.

#### Example 19 (Synthesis of octameric platform 113)

To a nitrogen sparged solution of 0.50 g (1.71 mmol) of compound 21b in 8 mL of MeOH at 0°C was added 537 µL of a 25% solution of NaOMe in MeOH (2.57 mmol), the mixture was stirred at 0°C for 2 hours, 5.14 mL (5.14 mmol) of nitrogen sparged 1M KHCO<sub>3</sub> solution was added, and the mixture was stirred at 0°C under nitrogen for 15 minutes. To the mixture was added dropwise a solution of 283 mg (0.14 mmol) of compound 111 (prepared as described in Xeno patent) in 10 mL of 2/1 MeOH/water. The reaction mixture was concentrated to remove MeOH and the concentrate was redissolved in acetonitrile. The reaction mixture was then stirred at room temperature under nitrogen for 3 days, concentrated, and partitioned between 40 mL of EtOAc and 20 mL of water. The EtOAc layer was concentrated, and the product was purified by chromatography on Amberchrom® (70/30 acetonitrile/H<sub>2</sub>O to provide 100 mg of compound 112 as a white powder: <sup>1</sup>H NMR (CD<sub>3</sub>OD): δ 1.36 (m, 48H), 1.42 (s, 72H), 1.57 (m, 64H), 2.14 (m, 8H), 2.55 (m, 16H), 3.11 (m, 36H), 3.24 (m, 8H), 3.30 (brd s, 16H), 3.71 (t, 16H), 4.2 (m, 4H); <sup>13</sup>C NMR (CD<sub>3</sub>OD): δ 24.31, 25.58, 26.73, 27.77, 28.82, 29.16, 29.73, 29.78, 30.17, 30.24, 30.35, 33.21, 33.69, 36.35, 36.53, 37.17, 38.87, 39.09, 40.43, 40.53, 54.95, 66.07, 70.50, 71.65, 77.44, 82.00, 158.25, 159.20, 172.63, 172.78, 173.97, 176.28; mass spectrum (ESI) (M+2Na)/2 calculated for C<sub>168</sub>H<sub>312</sub>Na<sub>2</sub>N<sub>26</sub>O<sub>46</sub>S<sub>8</sub>: 1866. Found 1866.

Compound 113: The Boc-protecting groups are removed from compound 112 in a manner essentially similar to that described for the preparation of compound 16 to provide 113. The Reaction Scheme is shown in Figure 27.

Example 20 (Synthesis of compound 125)

Compound 115: To a solution of 8.00 g (13.4 mmol) of compound 114 (prepared as described in U.S. Pat. No. 5,552,391) in 80 mL of anhydrous DMF was added 4.00 g (16.1 mmol) of N-(benzyloxycarbonyloxy)succinimide (Aldrich Chemical Co.). The mixture was stirred for 2 hours under nitrogen at room temperature, at which time it was poured into 600 mL of ice water and extracted with four 100 mL portions of CH<sub>2</sub>Cl<sub>2</sub>. The combined CH<sub>2</sub>Cl<sub>2</sub> layers were washed with 100 mL of H<sub>2</sub>O, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated. Concentration from heptane helped to solidify the crude product. Recrystallization from EtOAc gave compound 115 as a white solid: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.26 (m, 4H), 1.43-1.62 (m, 8H), 2.05 (m, 4H), 3.16 (q, 4H), 3.40 (brd s, 8H), 4.98 (s, 2H) overlapped with 5.08 (s, 4H) and 5.11 (s, 2H), 6.31 (s, 1H), 6.44 (s, 1H), 7.26-7.38 (m, 15H).

Synthesis of triamine, compound 116: A solution of 9.0 g (12.3 mmol) of compound 115 in 18 mL of cyclohexane and 36 mL of anhydrous ethanol was deoxygenated by bubbling N<sub>2</sub> gas through it. To the solution was added 1.80 g of 10% Pd/C, and the mixture was heated at reflux for 3 hours. When cool, the mixture was filtered through Celite® using MeOH to rinse. The filtrate was concentrated, and the concentrate was concentrated from CH<sub>2</sub>Cl<sub>2</sub> to provide 4.20 g (87%) of compound 116 as an off white solid.

Synthesis of compound 117: To a solution of 5.39 g (21.8 mmol) of compound 105 in 10 mL of anhydrous acetonitrile was added 3.02 g (23.9 mmol) of CDI (carbonyldiimidazole), and the mixture was stirred for 1.5 hours under nitrogen atmosphere. The resulting solution was added to a solution of 4.20 g (10.7 mmol) of compound 116 in 15 mL of anhydrous DMF, and the mixture was stirred for 2 hours and poured into 500 mL of ice water. The resulting mixture was extracted with four 100 mL portions of CH<sub>2</sub>Cl<sub>2</sub>. The combined CH<sub>2</sub>Cl<sub>2</sub> layers were washed with 100 mL of H<sub>2</sub>O, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated. The resulting semisolid residue was crystallized from 10% isopropyl alcohol/EtOAc to provide 4.0 g (44%) of 117 as a white solid: <sup>1</sup>H NMR CDCl<sub>3</sub> (δ) 1.35 (m, 4H), 1.42 (m, 4H), 1.49 (s, 18H), 1.63 (m,

16H), 2.01 (brd s, 1H), 2.20 (t, 4H), 3.23 (m, 4H), 3.34 (m, 4H), 3.85 (t, 4H), 6.34 (t, 2H), 6.70 (t, 2H), 7.98 (brd s, 1H).

Compound 119: To a solution of 3.65 g (14.11 mmol) of 9-fluorenylmethylchloroformate (Fmoc-Cl) in 15 mL of dioxane was added a solution of 3.00 g (15.5 mmol) of compound 118 (Bondunov *et al.*, J. Org. Chem. 1995, Vol. 60, pp. 6097-6102) in 15 mL of dioxane followed by a solution of 1.95 g (14.11 mmol) of potassium carbonate in 30 mL of H<sub>2</sub>O. The mixture was stirred for 18 hours at room temperature and concentrated. The resulting oil was partitioned between 50 mL of 1 N NaOH solution and three 150 mL portions of CH<sub>2</sub>Cl<sub>2</sub>. The combined CH<sub>2</sub>Cl<sub>2</sub> layers were dried (MgSO<sub>4</sub>), filtered, and concentrated to a yellow oil. Purification by silica gel chromatography (step gradient; 90/10 EtOAc/AcOH to 90/10/1 EtOAc/AcOH/MeOH) to give 3.85 g (66%) of 119 as a viscous oil: <sup>1</sup>H NMR CDCl<sub>3</sub> (δ) 3.26 (m, 4H), 3.39 (m, 2H), 3.49 (m, 2H), 3.59 (m, 2H), 3.65 (m, 4H), 3.69 (m, 2H), 4.25 (t, 1H), 4.60 (d, 2H), 7.35 (t, 2H), 7.41 (t, 2H), 7.59 (d, 2H), 7.78 (d, 2H).

Compound 120: To a solution of 3.77 g (9.08 mmol) of compound 119 and 7.32 g (36.3 mmol) of 4-nitrophenylchloroformate in 50 mL of CH<sub>2</sub>Cl<sub>2</sub> at 0°C was added 5.88 mL (5.75 g, 72.6 mmol) of pyridine. The mixture was stirred at room temperature under nitrogen atmosphere for 72 hours, and the mixture was partitioned between 200 mL of CH<sub>2</sub>Cl<sub>2</sub> and four 100 mL portions of 10% aqueous sodium bicarbonate solution. The CH<sub>2</sub>Cl<sub>2</sub> layer was washed successively with 100 mL of H<sub>2</sub>O, 100 mL of 1 N HCl, then 100 mL of brine. The solution was dried (MgSO<sub>4</sub>), filtered, and concentrated to yield an orange oil. Purification by silica gel chromatography (15/50/35/1 EtOAc/CH<sub>2</sub>Cl<sub>2</sub>/hexane/AcOH) to provide 2.67 g (39%) of compound 120 as a yellow gum: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 3.32 (m, 4H), 3.52 (m, 2H), 3.60 (m, 4H), 3.74 (m, 2H), 4.23 (t, 1H), 4.38 (m, 2H), 4.41 (m, 2H), 4.57 (d, 2H), 7.37 (m, 8H), 7.59 (d, 2H), 7.78 (d, 2H), 8.26 (overlapping d, 4H); mass spectrum (ESI) (M+H) calculated for C<sub>37</sub>H<sub>36</sub>N<sub>3</sub>O<sub>14</sub>: 746. Found 746.

Compound 121: To a solution of 482 mg (0.612 mmol) of compound 117 in 5 mL of CH<sub>2</sub>Cl<sub>2</sub> was added 182 mg (0.245 mmol) of compound 120 followed by 171 μL (124 mg, 1.22 mmol) of Et<sub>3</sub>N and 26 mg (.490 mmol) of HOBt. The mixture was

stirred at room temperature until the reaction was complete as judged by TLC (1/9 MeOH/CH<sub>2</sub>Cl<sub>2</sub>). The mixture was partitioned between 300 mL of CH<sub>2</sub>Cl<sub>2</sub> and three 50 mL portions of 1 N HCl. The CH<sub>2</sub>Cl<sub>2</sub> layer was washed with brine, dried (MgSO<sub>4</sub>), filtered, and concentrated to a yellow oil. Purification by silica gel chromatography (multiple step gradient; 5/1/94 to 10/1/89 to 15/1/84 to 20/1/79 MeOH/HOAc/CH<sub>2</sub>Cl<sub>2</sub>) to provide 317 mg (63%) of compound 121 as a sticky white solid: <sup>1</sup>H NMR (CD<sub>3</sub>OD) δ 1.34 (m, 16H), 1.43 (m, 8H), 1.48 (s, 36H), 1.64 (m, 24H), 2.20 (m, 16H), 3.19 (m, 12H), 3.25-3.52 (m, 18H), 3.55 (m, 2H), 3.79 (t, 8H), 4.16 (m, 4H), 4.28 (t, 1H), 4.59 (d, 2H), 7.33 (t, 2H), 7.41 (t, 2H), 7.60 (d, 2H), 7.84 (d, 2H); <sup>13</sup>C NMR (CD<sub>3</sub>OD) δ 14.6, 23.8, 26.7, 26.7, 26.9, 27.7, 28.8, 28.9, 30.3, 37.1, 38.8, 39.1, 40.3, 65.8, 66.0, 68.1, 70.2, 70.3, 77.3, 82.0, 121.2, 126.0, 128.4, 129.0, 142.9, 145.6, 157.9, 158.2, 159.2, 176.1, 176.3; mass spectrum (ESI) (M+2Na)/2 calculated for C<sub>101</sub>H<sub>171</sub>Na<sub>2</sub>N<sub>15</sub>O<sub>28</sub>: 1044. Found 1044.

Compound 122: To a solution of 163 mg (79.8 mmol) of compound 121 in 2.4 mL of DMF was added 600 μL of diethylamine. The mixture was stirred for 3 hours and concentrated. Purification by silica gel chromatography (multi-step gradient; 10/1/89 to 12.5/6/86.5/ to 15/1/84 MeOH/con NH<sub>4</sub>OH/CH<sub>2</sub>Cl<sub>2</sub>) gave 127 mg (81%) of compound 122 as a glassy gum: <sup>1</sup>H NMR (CD<sub>3</sub>OD) δ 1.38 (m, 16H), 1.48 (m, 44H), 1.65 (m, 24H), 2.20 (t, 16H), 2.83 (t, 4H), 3.17 (t, 8H), 3.38 (m, 16H), 3.63 (t, 4H), 3.69 (t, 4H), 3.78 (t, 4H), 4.21 (m, 4H); <sup>13</sup>C NMR (CD<sub>3</sub>OD) δ 26.7, 27.0, 27.8, 28.8, 28.9, 30.3, 37.1, 38.8, 39.1, 40.3, 49.9, 66.0, 70.4, 70.9, 77.3, 82.0, 158.2, 159.2, 176.1, 176.3; mass spectrum (ESI) (M+H) calculated for C<sub>86</sub>H<sub>162</sub>N<sub>15</sub>O<sub>26</sub>: 1821. Found 1821.

Compound 124b: To a solution of 20 mg (11.0 μmol) of compound 122 in 5 mL of DMF was added 103 mg (8.8 μmol) of methoxypolyethyleneglycol benzotriazolylcarbonate of molecular weight 11,690 g/mol (mPEG<sub>12K</sub>-BTC, compound 123b, Shearwater Polymers) followed by 5 μL (3.6 mg, 35.9 μmol) of Et<sub>3</sub>N. The mixture was stirred at room temperature for 18 hours and concentrated. The residue was purified by silica gel chromatography (multi-step gradient; 5/95 to 15/85 to 20/80 MeOH/CH<sub>2</sub>Cl<sub>2</sub>) to provide 109 mg of compound 124b as a waxy off

white solid:  $^1\text{H}$  NMR ( $\text{CDCl}_3$ )  $\delta$  1.37 (m, 16H), 1.49 (m, 44H), 1.65 (m, 24H), 2.20 (t, 16H), 3.20 (q, 8H), 3.36 (m, 16H), 3.61 (m, 4H), 3.68 (m, approximately 1056H), 3.84 (t, 8H), 3.91 (m, 4H), 4.23 (m, 4H).

Compound 124a: This compound was prepared using essentially the same procedure used for the preparation of compound 124b; however, methoxypolyethyleneglycol benzotriazolylcarbonate of molecular weight 5,215 g/mol (mPEG<sub>5K</sub>-BTC, compound 123a, Shearwater Polymers) was used:  $^1\text{H}$  NMR (4:1  $\text{CDCl}_3/\text{CD}_3\text{OD}$ )  $\delta$  1.37 (m, 16H), 1.49 (m, 44H), 1.65 (m, 24H), 2.20 (t, 16H), 3.20 (q, 8H), 3.36 (m, 16H), 3.61 (m, 4H), 3.68 (m, approximately 468H), 3.84 (t, 8H), 3.91 (m, 4H), 4.23 (m, 4H).

Compound 124c: This compound was prepared using essentially the same procedure used for the preparation of compound 124b; however, methoxypolyethyleneglycol benzotriazolylcarbonate of molecular weight 22,334 g/mol (mPEG<sub>20K</sub>-BTC, compound 123c, Shearwater Polymers) was used:  $^1\text{H}$  NMR (5:1  $\text{CDCl}_3/\text{CD}_3\text{OD}$ )  $\delta$  1.37 (m, 16H), 1.49 (m, 44H), 1.65 (m, 24H), 2.20 (t, 16H), 3.20 (q, 8H), 3.36 (m, 16H), 3.61 (m, 4H), 3.68 (m, approximately 2024H), 3.84 (t, 8H), 3.91 (m, 4H), 4.23 (m, 4H).

Compound 125b: The Boc-protecting groups are removed from compounds 124a-c in a manner essentially similar to that described for the preparation of compound 16 to provide compounds 125a-c.

The reaction scheme is shown in Figure 28.

#### Example 21 (Synthesis of compound 129)

Compound 126: To a solution of 14 mg (18.6  $\mu\text{mol}$ ) of compound 120 and 29 mg (186.3  $\mu\text{mol}$ ) of HOBT in 5 mL of anhydrous DMF was added 56  $\mu\text{L}$  (38 mg, 373  $\mu\text{mol}$ ) of  $\text{Et}_3\text{N}$ . The mixture was stirred for 1 hour and a solution of 85 mg (46.6  $\mu\text{mol}$ ) of compound 122 in 1 mL of DMF was added. The mixture was stirred at room temperature for 5 hours and partitioned between 150 mL of  $\text{CH}_2\text{Cl}_2$  and 50 mL of 1 N HCl. The  $\text{CH}_2\text{Cl}_2$  layer was washed with brine, dried ( $\text{MgSO}_4$ ), filtered, and concentrated. Purification by silica gel chromatography provided 34 mg (44%) of compound 126 as a waxy white solid:  $^1\text{H}$  NMR ( $\text{CD}_3\text{OD}$ )  $\delta$  1.37 (m, 32H), 1.49 (m

overlapping s at 1.48, 88H) 1.62 (m, 48H), 2.20 (t, 32H), 3.18 (t, 16H), 3.36 (m, 32H), 3.50 (m, 12H), 3.64 (m, 24H), 3.79 (t, 16H) 4.17 (m, 12H), 4.29 (t, 1H), 4.60 (d, 2H), 7.37 (t, 2H), 7.43 (t, 2H), 7.65 (d, 2H), 7.84 (d, 2H); mass spectrum (ESI) (M+3Na)/3 calculated for C<sub>197</sub>H<sub>347</sub>Na<sub>3</sub>N<sub>31</sub>O<sub>60</sub>: 1393. Found 1393.

5            Compound 127: To a solution of 34 mg (8.27  $\mu$ mol) of compound 126 in 1.6 mL of DMF was added 400  $\mu$ L of diethylamine. The mixture was stirred at room temperature for 4 hours and concentrated. The concentrate was purified by silica gel chromatography (1/10/89 con NH<sub>4</sub>OH/MeOH/CH<sub>2</sub>Cl<sub>2</sub>) to provide 13 mg (40%) of compound 127: <sup>1</sup>H NMR (CD<sub>3</sub>OD)  $\delta$  1.35 (m, 32H), 1.49 (m overlapping s at 1.48, 88H), 1.63 (m, 48H), 2.19 (t, 32H), 3.08 (brd t, 4H) 3.17 (t, 16H), 3.38 (m, 36H), 10    3.52 (m, 8H), 3.63 (t, 8H), 3.70 (m, 12H), 3.78 (t, 16H), 4.21 (m, 12H); mass spectrum (ESI) (M+3Na)/3 calculated for C<sub>182</sub>H<sub>337</sub>Na<sub>3</sub>N<sub>31</sub>O<sub>58</sub>: 1319. Found 1319.

Compound 128: To a solution of 13 mg (3.34  $\mu$ mol) of compound 127 in 5 mL of pyridine was added 60 mg (2.68  $\mu$ mol) of methoxypolyethyleneglycol benzotriazolylcarbonate of molecular weight 22,334 g/mol (mPEG<sub>20K</sub>-BTC, Shearwater Polymers) followed by 5  $\mu$ L (3.6 mg, 35.9  $\mu$ mol) of Et<sub>3</sub>N. The mixture was stirred at room temperature for 18 hours and concentrated. The residue was purified by silica gel chromatography (multi-step gradient; 10/90 to 15/85 to 20/80 MeOH/CH<sub>2</sub>Cl<sub>2</sub>) to provide 45 mg of compound 128 as a waxy solid: <sup>1</sup>H NMR (CDCl<sub>3</sub>)  $\delta$  1.30 (m, 32H), 1.50 (m overlapping s at 1.48, 88H), 1.67 (m, 48H), 2.24 (t, 32H), 3.23 (m, 16H), 3.41 (m, 32H), 3.65 (m, approximately 2024H), 3.70 (t, 24H), 15    3.89 (m, 16H), 4.21 (m, 12H).

Compound 129: The Boc-protecting groups are removed from compound 128 in a manner essentially similar to that described for the preparation of compound 16 25    to provide compounds 129, as shown in Figure 29.

#### Example 22 (Synthesis of compound 132)

Compound 131: To a solution of 22 mg (27.3  $\mu$ mol) of compound 117 in 5 mL of pyridine was added 236 mg (10.9  $\mu$ mol) of polyethyleneglycol bis-benzotriazolylcarbonate of molecular weight 21,529 g/mol (PEG<sub>20K</sub>-bis-BTC, compound 130, Shearwater Polymers) followed by 8  $\mu$ L (5.8 mg, 57.4  $\mu$ mol) of Et<sub>3</sub>N. 30

The mixture was stirred at room temperature for 18 hours and concentrated. The residue was purified by silica gel chromatography (multi-step gradient; 5/95 to 10/90 to 15/85 to 20/80 MeOH/CH<sub>2</sub>Cl<sub>2</sub>) to provide 242 mg (96%) of compound 131 as a white solid: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.35 (m, 16H), 1.48 (m, 44H), 1.61 (m, 24H), 2.20 (m, 16H), 3.22 (m, 8H), 3.52-3.96 (m, approximately 2000H), 4.23 (m, 4H).

Compound 132: The Boc-protecting groups are removed from compound 131 in a manner essentially similar to that described for the preparation of compound 16 to provide compound 132.

The reaction scheme is shown in Figure 30.

#### Example 23 (Synthesis of compound 136)

Compound 134: To a solution of 3.87 mg (4.85 μmol) of pentaerythritol tetrakis-(4-nitrophenylcarbonate ester) (prepared by reaction of pentaerythritol with *para*-nitrophenylchloroformate to yield the tetra *para*-nitrophenylcarbonate compound) in 5 mL of pyridine was added 124 mg (24.2 μmol) of mono-Boc-protected diaminopolyethylene glycol of molecular weight 5094 g/mol (compound 133, BocNH-PEG<sub>(5K)</sub>-NH<sub>2</sub>), and 5 μL (3.63 mg, 35.9 μmol) of Et<sub>3</sub>N. The mixture was stirred for 18 hours and concentrated. The residue was purified by silica gel chromatography (step gradient; 5/95 to 15/85 MeOH/CH<sub>2</sub>Cl<sub>2</sub>) to provide 77 mg (77%) of compound 134 as a white solid: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.48 (s, 36H), 3.32 (m, 16H), 3.52-3.96 (m, approximately 1818H), 4.10 (m, 8H).

Compound 135: Compound 134 (77 mg, 3.73 μmol) was dissolved in 5 mL of trifluoroacetic acid, and the mixture was allowed to stand for three hours. The TFA was removed under a stream of N<sub>2</sub> and the residue was dissolved in 5 mL of CH<sub>2</sub>Cl<sub>2</sub>. To the resulting solution was added a solution of 7.72 mg (22.4 μmol) of compound 106 in 5 mL of CH<sub>2</sub>Cl<sub>2</sub> followed by 35 μL (25.4 mg, 251 μmol) of Et<sub>3</sub>N. (Note: The pH of the mixture should be checked and adjusted accordingly with Et<sub>3</sub>N to make sure it is basic.) The mixture was stirred under nitrogen for 18 hours. The mixture was partitioned between 50 mL of CH<sub>2</sub>Cl<sub>2</sub> and three 25 mL portions of 1 N HCl. The CH<sub>2</sub>Cl<sub>2</sub> layer was washed with brine, dried (MgSO<sub>4</sub>), filtered and concentrated. Purification by silica gel chromatography (step gradient; 5/95 to 10/90

MeOH/CH<sub>2</sub>Cl<sub>2</sub>) provided 42 mg (53%) of compound 135 as waxy solid: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.40 (m, 8H), 1.48 (s, 36H), 1.66 (m, 16H), 2.18 (t, 8H), 3.32 (m, 16H), 3.38-3.89 (m, approximately 1818H), 4.10 (m, 8H), 4.97 (t, 4H), 6.43 (t, 4H), 7.47 (s, 4H).

5            Compound 136: The Boc-protecting groups are removed from compound 135 in a manner essentially similar to that described for the preparation of compound 16 to provide compound 136, as shown in Figure 31.

Example 24 (Synthesis of compound 143)

10            Compound 137: To a 0°C solution of 200 mg (1.11 mmol) of ethyl 3,5-diaminobenzoate in 5 mL of CH<sub>2</sub>Cl<sub>2</sub> under nitrogen atmosphere was added 928 μL (674 mg, 6.66 mmol) of Et<sub>3</sub>N. To the mixture was added dropwise a solution of 510 μL (710 mg, 3.33 mmol) of 6-bromohexanoyl chloride in 5 mL of CH<sub>2</sub>Cl<sub>2</sub>. The mixture was stirred at room temperature for 1.5 hours and partitioned between 50 mL of 1 N HCl and two 50 mL portions of CH<sub>2</sub>Cl<sub>2</sub>. The CH<sub>2</sub>Cl<sub>2</sub> layers were washed with saturated sodium bicarbonate solution, dried (MgSO<sub>4</sub>), filtered and concentrated. The product was purified by silica gel chromatography (6/4 hexane/EtOAc) to give 554 mg (93%) of compound 137 as an oil: <sup>1</sup>H NMR (CDCl<sub>3</sub>): δ 1.39 (t, 3H), 1.52 (m, 4H), 1.75 (m, 4H), 1.90 (m, 4H), 2.40 (t, 4H), 3.42 (t, 4H), 4.36 (q, 2H), 7.60 (s, 2H), 7.88 (s, 2H), 8.17 (s, 1H).

15            Compound 138: DBU (612 μL, 623 mg, 4.01 mmol) was added to a solution of 547 mg (1.02 mmol) of compound 137 and 272 mg (2.05 mmol) of N-(tert-butyloxycarbonyl)hydroxylamine (Aldrich Chemical Co.). The mixture was stirred for 18 hours at room temperature and partitioned between 50 mL of 1 N HCl and three 50 mL portions of CH<sub>2</sub>Cl<sub>2</sub>. The combined CH<sub>2</sub>Cl<sub>2</sub> layers were dried (MgSO<sub>4</sub>), filtered, and concentrated. The product was purified by silica gel chromatography (1/1 hexane/EtOAc) to give 216 mg (33%) of compound 138 as a white solid: mp 55-60°C; <sup>1</sup>H NMR (CDCl<sub>3</sub>): δ 1.38 (t, 3H), 1.48 (s, 18H; buried m, 4H), 1.60 (m, 4H), 1.73 (m, 4H), 2.40 (m, 4H), 3.86 (t, 4H), 4.36 (q, 2H), 7.41 (s, 2H), 7.90 (s, 2H), 8.06 (s, 2H), 8.11 (s, 1H); mass spectrum (ESI) (M+Na) calculated for C<sub>31</sub>H<sub>50</sub>NaN<sub>4</sub>O<sub>10</sub>: 661. Found 661.

003090-26506560

Compound 139: To a solution of 205 mg (0.32 mmol) of compound 138 in 1/1 acetone/EtOH was added 256  $\mu$ L (2.56 mmol) of 10 N NaOH, and the mixture was heated to 60°C for 4 hours. When cool, the mixture was partitioned between 50 mL of 1 N HCl and four 50 mL portions of 4/1 CH<sub>2</sub>Cl<sub>2</sub>/MeOH. The combined organic layers were dried (MgSO<sub>4</sub>), filtered, and concentrated. The product was purified by silica gel chromatography (3/97/1 MeOH/CH<sub>2</sub>Cl<sub>2</sub>/HOAc) to give 184 mg (94%) of compound 139 as a viscous oil: <sup>1</sup>H NMR (CDCl<sub>3</sub>):  $\delta$  1.38 (m, 4H), 1.42 (s, 18H), 1.60 (m, 4H), 1.70 (m, 4H), 2.38 (m, 4H), 3.80 (t, 4H), 7.77 (s, 2H), 8.00 (s, 2H), 8.11 (s, 1H), 8.91 (s, 2H); mass spectrum (ESI) (M+Na) calculated for C<sub>29</sub>H<sub>46</sub>NaN<sub>4</sub>O<sub>10</sub>: 633. Found 633.

Compound 140: To a 0°C solution of 164 mg (0.268 mmol) of compound 139 in 2.0 mL of dry THF was added 31 mg (0.268 mmol) of N-hydroxysuccinimide, followed by 83 mg (0.403 mmol) of DCC. The mixture was allowed to come to room temperature and stirred for 18 hours under nitrogen atmosphere, and 200  $\mu$ L of HOAc was added. The mixture was stirred for another hour, diluted with approximately 5 mL of EtOAc, and allowed to stand for an hour. The resulting precipitate was removed by filtration, and the filtrate was concentrated. Purification by silica gel chromatography (3/97/ MeOH/CH<sub>2</sub>Cl<sub>2</sub>) provided 129 mg (68%) of compound 140 as a white solid: <sup>1</sup>H NMR (CDCl<sub>3</sub>):  $\delta$  1.40 (m, 4H), 1.43 (s, 18H), 1.65 (m, 4H), 1.80 (m, 4H), 2.34 (m, 4H), 2.93 (s, 4H), 3.85 (t, 4H), 7.68 (s, 2H), 7.87 (s, 2H), 8.36 (s, 1H), 8.61 (s, 2H).

Compound 142: To a solution of 60 mg (0.85 mmol) of compound 140 in 0.5 mL of CH<sub>2</sub>Cl<sub>2</sub> was added 14  $\mu$ L (13.3 mg, 0.168 mmol) of pyridine. The mixture was cooled to 0°C and a solution of 71 mg (0.021 mmol) of diamino-PEG, compound 141, in 0.5 mL of CH<sub>2</sub>Cl<sub>2</sub> was added. The mixture was stirred under nitrogen atmosphere at room temperature for 18 hours, and partitioned between 10 mL of 1 N HCl and three 10 mL portions of CH<sub>2</sub>Cl<sub>2</sub>. The combined CH<sub>2</sub>Cl<sub>2</sub> layers were dried (MgSO<sub>4</sub>), filtered, and concentrated. Purification by silica gel chromatography (step gradient 5/95 MeOH/CH<sub>2</sub>Cl<sub>2</sub> to 10/90 MeOH/CH<sub>2</sub>Cl<sub>2</sub>) provided 66 mg (69%) of compound 142 as a viscous oil: <sup>1</sup>H NMR (CDCl<sub>3</sub>):  $\delta$  1.45 (s, 36H), 1.60-1.80 (m, 24H), 2.39 (t, 8H), 3.39 (m, 8H), 3.50-3.80 (brd s, approx. 318H), 3.87 (t, 8H), 4.22

(t, 4H), 7.50 (brd s, 2H), 7.63 (s, 4H), 7.77 (s, 2H), 8.08 (s, 2H), 8.60 (s, 2H); mass spectrum (MALDI) (M+H) calculated for  $C_{207}H_{389}N_{12}O_{93}$ : 4535. Found distribution centered at approximately 4324.

Compound 143: The Boc-protecting groups are removed from compound 142 in a manner essentially similar to that described for the preparation of compound 16 to provide 143, as shown in Figure 32.

#### Example 25- Method of Preparation of Conjugates

Conjugates 200, 201, 202, 203, 204, and 205 (Figure 33) were prepared as follows.

Compound 200: To a solution of 68.8 mg (9.74  $\mu$ mol, 6 equivalents) of TA/D1 in 10 mL of helium sparged 0.1 M, pH 4.6 sodium acetate buffer was added a solution of 36.8 mg (1.62  $\mu$ mol) of compound 125c in 6.15 mL of 1/1 acetonitrile/0.1 M, pH 8.0 tris acetate buffer. Care was taken to keep the mixture under nitrogen atmosphere while stirring at room temperature for 18 hours. When the reaction was complete, it was directly purified by cation exchange chromatography using a PolyCat A WCX column manufactured by PolyLC Inc. (gradient 10%B to 25%B, A = 10 mM sodium phosphate pH 7 in 1/9 acetonitrile/H<sub>2</sub>O) to provide 57 mg (40%) of compound 200.

Compound 201: Compound 201 was prepared in a manner essentially similar to compound 200. Thus, to an approximately 1 mM solution of 6 equivalents of TA/D1 in helium sparged 0.1 M, pH 4.6 sodium acetate buffer was added 1 equivalent of compound 125a as a 0.25 to 10 mM solution in 1/1 acetonitrile/0.1 M, pH 8.0 tris acetate buffer. Care was taken to keep the mixture under nitrogen atmosphere while stirring at room temperature for 18 hours. When the reaction was complete, it was directly purified by cation exchange chromatography to provide compound 201.

Compound 202: Compound 202 was prepared in a manner essentially similar to 200. Thus, to an approximately 1 mM solution of 6 equivalents of TA/D1 in helium sparged 0.1 M, pH 4.6 sodium acetate buffer was added 1 equivalent of compound 132 as a 0.25 to 10 mM solution in 1/1 acetonitrile/0.1 M, pH 8.0 tris

acetate buffer. Care was taken to keep the mixture under nitrogen atmosphere while stirring at room temperature for 18 hours. When the reaction was complete, it was directly purified by cation exchange chromatography to provide compound 202.

5        Compound 203: Compound 203 was prepared in a manner essentially similar to 200. Thus, to an approximately 1 mM solution of 6 equivalents of TA/D1 in helium sparged 0.1 M, pH 4.6 sodium acetate buffer was added 1 equivalent of compound 136 as a 0.25 to 10 mM solution in 1/1 acetonitrile/0.1 M, pH 8.0 tris acetate buffer. Care was taken to keep the mixture under nitrogen atmosphere while stirring at room temperature for 18 hours. When the reaction was complete, it was  
10       directly purified by cation exchange chromatography to provide compound 203.

15       Compound 204: Compound 204 was prepared in a manner essentially similar to 200. Thus, to an approximately 1 mM solution of 6 equivalents of TA/D1 in helium sparged 0.1 M, pH 4.6 sodium acetate buffer was added 1 equivalent of compound 143 as a 0.25 to 10 mM solution in 1/1 acetonitrile/0.1 M, pH 8.0 tris acetate buffer. Care was taken to keep the mixture under nitrogen atmosphere while stirring at room temperature for 18 hours. When the reaction was complete, it was  
20       directly purified by cation exchange chromatography to provide compound 204.

25       Compound 205: Compound 205 was prepared in a manner essentially similar to 200. Thus, to an approximately 1 mM solution of 6 equivalents of TA/D1 in helium sparged 0.1 M, pH 4.6 sodium acetate buffer was added 1 equivalent of compound 125b as a 0.25 to 10 mM solution in 1/1 acetonitrile/0.1 M, pH 8.0 tris acetate buffer. Care was taken to keep the mixture under nitrogen atmosphere while stirring at room temperature for 18 hours. When the reaction was complete, it was  
30       directly purified by cation exchange chromatography to provide compound 205.

#### Example 26: Evaluation of Toleragen Efficiency and Serum Half-Life

Domain 1 – keyhole limpet hemocyanin conjugate (D1-KLH) was prepared for use in animal immunization. Recombinant Domain 1 with a fifth cysteine was expressed as a glutathione mixed disulfide in insect cells using the baculovirus expression vector system. The structure consists of the first 66 amino-terminal amino acids present in native human  $\beta_2$ -glycoprotein I followed by a C-terminal leu-(his)<sub>5</sub>

65

expression tag. The polyhistidine expression tag at the C-terminus was the basis for a purification procedure by nickel affinity chromatography. Iverson *et al.* (1998) *Proc. Nat'l. Acad. Sci.* 95: 15542-15546.

5 The resulting Domain 1 with a free sulfhydryl (D1-SH) was alkylated by maleimidyl-KLH. Maleimidyl-activated KLH (Pierce Chemical Co.; Rockford, IL) was dissolved at 10 mg/mL in water as per the manufacturer's instructions. Immediately, the KLH was added to D1-SH at a ratio of 1.27 mg per mg D1-SH. The tube containing the KLH and D1 was mixed by rotation at 2h x RT. At the end of the incubation the contents were dialyzed against cold PBS at 4° C using a >25,000 MW  
10 cut-off membrane for the removal of unconjugated D1. An aliquot of the dialyzed sample was removed and tested for the presence of immunoreactive D1 by an ELISA with patient-derived affinity purified antiphospholipid antibodies (aPL).

An immunized rat model was used for measuring toleragen efficacy. Lewis rats (Harlan Sprague Dawley, Indianapolis, IN) were immunized i.p. with 10 µg of  
15 D1-KLH in alum with pertussis adjuvant. Three weeks after priming, groups of four animals were treated i.v. with toleragen or PBS control. Five days after treatment animals were boosted i.p. with 10 µg D1-KLH, and sera samples were collected seven days after boost.

An ELISA was used for detection of anti-domain 1 antibody in rat sera. Nunc  
20 Maxisorp Immunoplates (Nalge Nunc International, Rochester, NY) were coated overnight with 50 µl of 5 µg/ml recombinant human β<sub>2</sub>-GPI in carbonate buffer (Sigma, St. Louis, MO) pH 9.6 at 4 °C. Subsequent steps were carried out at room temperature. Plates were washed 3x with phosphate buffered saline (PBS), then blocked 1 h with 250 µl 2% nonfat dry milk (Carnation, Solon, OH) in PBS. After  
25 washing, wells were incubated 1 h with 50 µl serial dilutions in PBS of each sera sample in triplicate. Non-immunized serum was used as control, and a pool of sera from immunized animals was used to generate a standard curve. After washing, the wells were incubated 1 h with 50µl alkaline phosphatase-conjugated goat anti-rat IgG (Jackson ImmunoResearch, West Grove, PA) diluted 1:2000 in PBS/0.1% BSA.  
30 Wells were washed 3x with dH<sub>2</sub>O and were developed 20 minutes with PMP

solution ((10 gm phenolphthalein mono-phosphate (Sigma, St. Louis MO), 97.4 ml 2-amino-2-methyl-1-propanol (Sigma), 9.62 ml dH<sub>2</sub>O, 21 ml HCl)). Color development was stopped with 50  $\mu$ l 0.2 M Na<sub>2</sub>HPO<sub>4</sub> and the OD<sub>550</sub> was read on a Bio-Tek Instruments PowerWave 340 Microplate Spectrophotometer (Winooski, VT). Nominal antibody units were assigned to the standard pool and the concentrations of anti-domain 1 antibody (units/ml) in test sera were derived from the standard curve. Percent suppression of anti-domain 1 antibody by Multivalent platform conjugate, using Conjugates 200, 201, 202 and 203 treatment was calculated by comparison to PBS-treated controls. The Results are shown in Table 1, below.

Table 1: Percent Suppression of Anti-Domain 1 Antibody in Immunized Rats

Compound	nanomoles drug/rat		
	0.17	1.7	17
200	61	82	89
201	34	73	86
202	72	89	96
203	73	93	94
By definition PBS control = 0% suppression			

The half life of compounds in in rat plasma was also determined. Compounds were radiolabeled with <sup>125</sup>I using the iodine monochloride method. Contreras et al., 1983, Methods in Enzymology 92: 277-292. Labeled compound was injected i.v. and plasma samples were collected periodically over 24 h. The amount of drug in plasma was detected using a Packard Instruments Model Cobra gamma counter (Downers Grove, IL). Pharmacokinetic parameters were calculated using WinNonLin software (Pharsight Corp., Mountain View, CA) and the plasma half-life was determined using the formula  $t_{1/2} = 0.693(\text{MRT})$ . The result are shown below in Table 2.

Table 2: Compound half life in rat plasma (hours)

204	8
200	20.2
201	9.8
205	14
202	18.4
203	20
